1 Mathematical proofs of chapter 4

Proof of Lemma 4.18 The lemma trivially holds if escape [S] = ff. Otherwise escape [S] = tt and the proof is by induction on the distance $\delta(S)$ of S to the root of the abstract syntax tree of P (where $\delta(P) = 0$).

- For Sl ::= Sl' S, δ (Sl') = δ (S) = δ (Sl)+1. So, in case escape [Sl] = tt, we have break-to [Sl] \neq after [Sl] by induction hypothesis. By def. escape [Sl] \triangleq escape [Sl'] \vee escape [S], there are two subcases.
 - If escape [Sl'] = tt then, on one hand, Sl ≠ { ... { ϵ }... }, after [Sl'] = at [S], break-to [Sl'] \triangleq break-to [Sl], at [S] \in in [S] by Lemma 4.15, so after [Sl'] \in in [S].

 On the other hand break-to [Sl'] \notin in [S] since otherwise break-to [Sl] = break-to [Sl'] \in in [S] \subseteq in [Sl] in contradiction with Lemma 4.17, proving break-to [Sl'] ≠ after [Sl'];
 - If escape[S] = tt then S ≠ { ... { ε }... }, after[S] = after[Sl], break-to[S] ≜ break-to[Sl], break-to[Sl] ≠ after[Sl] by induction hypothesis, so break-to[S] ≠ after[S].
- If $S ::= if^{\ell}$ (B) S_t then $escape[S_t] = escape[S] = tt$, $after[S_t] = after[S]$, $break-to[S_t] = break-to[S]$, and $break-to[S] \neq after[S]$ by induction hypothesis since $\delta(S_t) = \delta(S) + 1$, so $break-to[S_t] \neq after[S_t]$.
- The proof is similar for $S := if \ell$ (B) S_t else S_f and $S := \{ Sl \}$.

Mathematical proofs of chapter 41

Proof of Theorem 41.24 • For the statement list Sl ::= Sl' S, by (17.3) (following (6.13), and (6.14)), we have $\mathcal{S}^*[Sl] = \mathcal{S}^*[Sl'] \cup \{\langle \pi_1, \pi_2 \cap \pi_3 \rangle \mid \langle \pi_1, \pi_2 \rangle \in \mathcal{S}^*[Sl'] \land \langle \pi_1 \cap \pi_2, \pi_3 \rangle \}$ $\pi_3 \in \mathcal{S}^* \llbracket \mathsf{S} \rrbracket \}.$ - A first case is when $Sl' = \epsilon$ is empty. Then, $\alpha^{\exists l}_{\text{mod}}[\![\mathtt{Sl}]\!](\mathcal{S}^*[\![\mathtt{Sl}]\!])L_b, L_e$ $= \left[\left[\left\{ \alpha_{\text{use,mod}}^{l} \left[\epsilon \right] \right\} \right] L_{b}, L_{e} \left\langle \pi_{0}, \pi_{1} \right\rangle \mid \left\langle \pi_{0}, \pi_{1} \right\rangle \in \mathcal{S}^{*} \left[\epsilon \right] \right] \right]$ $\langle \operatorname{def.} (41.3) \operatorname{of} \alpha_{\text{use mod}}^{\exists l} [S] \text{ for Sl} ::= \epsilon S \rangle$ $= \bigcup \{\alpha_{\texttt{use}, \texttt{mod}}^l \ L_b, L_e \ \langle \pi_0 ^\ell, \ \pi_1 \rangle \ | \ \langle \pi_0 ^\ell, \ \pi_1 \rangle \ \in \ \mathcal{S}^* \llbracket \ \epsilon \ \rrbracket \ \cup \ \{\langle \pi_0 ^\ell, \ \pi_2 \ \widehat{} \ \pi_3 \rangle \ | \ \langle \pi_0 ^\ell, \ \pi_2 \rangle \in \mathcal{S}^* \llbracket \epsilon \ \rrbracket \}\}$ $= \bigcup \{\alpha_{\texttt{use},\texttt{mod}}^l \ L_b, L_e \ \langle \pi_0, \ \pi_1 \rangle \ | \ \langle \pi_0, \ \pi_1 \rangle \ \in \ \mathcal{S}^*[\![s]\!]\}\}$ $\langle (6.15) \text{ so that } \mathbf{S}^* \llbracket \epsilon \rrbracket = \{\langle \pi_0 \text{at} \llbracket \mathbf{S} \rrbracket \rangle \mid \pi_0 \text{at} \llbracket \mathbf{S} \rrbracket \in \mathbb{T}^+ \} \text{ and } \langle \pi_0 \text{at} \llbracket \mathbf{S} \rrbracket \rangle \in \mathbb{T}^+ \}$ $S^*[S]$ by (6.11) $= \alpha_{\text{use,mod}}^{\exists l} [\text{Sl}] (\boldsymbol{\mathcal{S}}^* [\![\text{S}]\!]) L_b, L_e$ $\langle \operatorname{def.}(41.3) \operatorname{of} \alpha_{use,mod}^{\exists l} [s] \rangle$ $= \alpha_{\text{disp.mod}}^{\exists l} [S] (S^*[S]) L_b, L_e$ (41.3) since after [S] = after [S], escape [S] = escape [S], and break-to [S] = break-to [S] when $Sl' = \epsilon \$ $\subseteq \widehat{\mathcal{S}}^{\, \boxplus \mathbb{I}}[\![\mathtt{S}]\!] \ L_b, L_e$ 7 ind. hyp. for Theorem 41.245 $=\widehat{\mathcal{S}}^{\parallel} \llbracket \mathsf{S} \rrbracket L_{b}, (\widehat{\mathcal{S}}^{\parallel} \llbracket \epsilon \rrbracket L_{b}, L_{e})$ i since $\widehat{S}^{\exists \parallel} \llbracket \epsilon \rrbracket L_b, L_e \triangleq L_e$ by (41.22) proving (41.22) when $Sl' = \epsilon$. - A second case is when $S = \{ \ldots \{ \epsilon \} \}$ is empty. Then, as required by (41.22), we have, by induction hypothesis, $\alpha_{\mathtt{use}, \mathtt{mod}}^{\exists l} \llbracket \mathtt{Sl} \rrbracket L_b, L_e = \alpha_{\mathtt{use}, \mathtt{mod}}^{\exists l} \llbracket \mathtt{Sl}' \rrbracket L_b, L_e \subseteq \widehat{\mathcal{S}}^{\exists l} L_b, L_e \subseteq \widehat{\mathcal$

- Otherwise, $Sl' \neq \epsilon$ and $S \neq \{ ... \{ \epsilon \} ... \}$ so, by Lemma 4.16, after $[S] \notin in [S]$. In that case, let us calculate

$$\begin{split} &\alpha_{\texttt{use},\texttt{mod}}^{\exists l} \llbracket \texttt{Sl} \rrbracket \ L_b, L_e \\ &= \bigcup \{\alpha_{\texttt{use},\texttt{mod}}^{l} \llbracket \texttt{Sl} \rrbracket \ L_b, L_e \ \langle \pi_0, \ \pi_1 \rangle \ | \ \langle \pi_0, \ \pi_1 \rangle \ \in \ \mathcal{S}^* \llbracket \texttt{Sl} \rrbracket \} \end{split} \qquad \text{$$(\texttt{def. (41.3) of } \alpha_{\texttt{use},\texttt{mod}}^{\exists l} \llbracket \texttt{S} \rrbracket)$}$$

$$= \{\langle \langle \mathsf{at}[\![S]\!], \rho \rangle, R' \rangle \mid \rho \in \mathbb{E} \mathbf{v} \land \langle \mathsf{L} : \mathsf{B}, R' \rangle = \mathsf{fstnxt}(R) \land \langle \underline{\varrho}, \langle \mathsf{at}[\![S]\!], \rho \rangle \rangle \in \mathcal{S}^{r}[\![L : \mathsf{B}]\!] \}$$

$$(44.24) \text{ with } \mathcal{M}^{t} \langle \underline{\varrho}, R' \rangle \Rightarrow = \langle \mathsf{tt}, R' \rangle \}$$

$$= \widehat{\mathcal{M}}^{+}[\![S]\!] \langle \varrho, R \rangle \qquad (44.44) \}$$

• In case (44.49) of an iteration statement $S := \text{while } \ell$ (B) S_b , we apply Corollary 18.31 so we have to calculate the abstract transformer that satisfies the commutation property for an iterate X of the concrete transformer $\mathscr{F}_{\mathbb{S}}^* \llbracket S \rrbracket$ (which traces must be of the form $\pi \langle \text{at} \llbracket S \rrbracket, \rho \rangle$).

$$\mathcal{M}^{\dagger}\langle\underline{\varrho},\ \mathsf{R}\rangle(\{\xi^*_{\mathbb{S}}^*[\mathbb{S}]X)\\ = \mathcal{M}^{\dagger}\langle\underline{\varrho},\ \mathsf{R}\rangle(\{\langle \ell,\ \rho\rangle\ |\ \rho\in\mathbb{E}\mathtt{v}\}\cup\{\pi_2\langle\ell',\ \rho\rangle\langle\mathsf{after}[\mathbb{S}],\ \rho\rangle\ |\ \pi_2\langle\ell',\ \rho\rangle\in X\wedge\mathcal{B}[\![\mathbb{B}]\!]\ \rho=\mathsf{ff}\wedge\ell'=\\ \ell^{\dagger}\cup\{\pi_2\langle\ell',\ \rho\rangle\langle\mathsf{at}[\![\mathbb{S}_b]\!],\rho\rangle\cdot\pi_3\ |\ \pi_2\langle\ell',\rho\rangle\in X\wedge\mathcal{B}[\![\mathbb{B}]\!]\ \rho=\mathsf{tt}\wedge\langle\mathsf{at}[\![\mathbb{S}_b]\!],\rho\rangle\cdot\pi_3\in\widehat{\mathcal{S}}^*_{\mathbb{S}}[\![\mathbb{S}_b]\!]\wedge\ell'=\ell\})\\ (42.6))$$

$$= \mathcal{M}^{\dagger}\langle\underline{\varrho},\ \mathsf{R}\rangle(\{\langle\ell,\rho\rangle\ |\ \rho\in\mathbb{E}\mathtt{v}\})\cup\mathcal{M}^{\dagger}\langle\underline{\varrho},\ \mathsf{R}\rangle(\{\pi_2\langle\ell',\rho\rangle\langle\mathsf{after}[\![\mathbb{S}]\!],\rho\rangle\ |\ \pi_2\langle\ell',\rho\rangle\in X\wedge\mathcal{B}[\![\mathbb{B}]\!]\ \rho=\\ \mathsf{ff}\wedge\ell'=\ell\})\cup\mathcal{M}^{\dagger}\langle\underline{\varrho},\ \mathsf{R}\rangle(\{\pi_2\langle\ell',\rho\rangle\langle\mathsf{at}[\![\mathbb{S}_b]\!],\rho\rangle\cdot\pi_3\ |\ \pi_2\langle\ell',\rho\rangle\in X\wedge\mathcal{B}[\![\mathbb{B}]\!]\ \rho=\mathsf{tt}\wedge\langle\mathsf{at}[\![\mathbb{S}_b]\!],\\ \rho\rangle\cdot\pi_3\in\widehat{\mathcal{S}}^*_{\mathbb{S}}[\![\mathbb{S}_b]\!]\wedge\ell'=\ell\})\\ (\mathsf{Galois\ connection\ }(44.30),\mathsf{so\ that},\mathsf{by\ Lemma\ }11.37,\mathcal{M}^{\dagger}\langle\varrho,\ \mathsf{R}\rangle\mathsf{\ preserves\ joins})$$

To avoid repeating (44.41), we assume that $R \notin \mathbb{R}_{\varepsilon}$ so we can let $\langle L' : B', R' \rangle = fstnxt(R)$. There are three subcases.

— The first case is that of an observation of the execution that stops at loop entry $\ell = at[S]$. This is similar to the above proof *e.g.* of (44.44) for a skip statement, and we get

$$\begin{split} & \boldsymbol{\mathcal{M}}^{+}\langle \underline{\varrho}, \, \mathsf{R}\rangle(\big\{\langle \mathsf{at}[\![\mathsf{S}]\!], \, \rho\rangle \mid \rho \in \mathbb{E} \mathsf{v} \big\} \\ & = \big\{\langle\langle \mathsf{at}[\![\mathsf{S}]\!], \, \rho\rangle, \, \mathsf{R}'\rangle \mid \rho \in \mathbb{E} \mathsf{v} \wedge \langle \mathsf{L}' : \mathsf{B}', \, \mathsf{R}'\rangle = \mathsf{fstnxt}(\mathsf{R}) \wedge \langle \underline{\varrho}, \, \langle \mathsf{at}[\![\mathsf{S}]\!], \, \rho\rangle\rangle \in \boldsymbol{\mathcal{S}}^r[\![\mathsf{L}' : \mathsf{B}']\!] \big\} \end{split}$$

The second case is that of the loop exit

```
\mathcal{M}^{\dagger}\langle \varrho, \, \mathsf{R}\rangle(\{\pi_2\langle \mathsf{at}[\![\mathsf{S}]\!], \, \rho\rangle \, \langle \, \mathsf{after}[\![\mathsf{S}]\!], \, \rho\rangle \, | \, \pi_2\langle \mathsf{at}[\![\mathsf{S}]\!], \, \rho\rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!] \, \rho = \mathsf{ff}\})
```

- $= \left\{ \langle \pi, \, \mathsf{R}' \rangle \; \middle| \; \pi \in \left\{ \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \; \rho \rangle \langle \mathsf{after}[\![\mathsf{S}]\!], \; \rho \rangle \; \middle| \; \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \; \rho \rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!] \; \rho = \mathsf{ff} \right\} \land \langle \mathsf{tt}, \; \mathsf{R}' \rangle = \mathcal{M}^t \langle \varrho, \, \mathsf{R} \rangle \pi \right\} \qquad \qquad ((44.25))$
- $= \left\{ \langle \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \; \rho \rangle \langle \mathsf{after}[\![\mathsf{S}]\!], \; \rho \rangle, \; \mathsf{R}' \rangle \; \middle| \; \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \; \rho \rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!] \; \rho = \mathsf{ff} \land \langle \mathsf{tt}, \; \mathsf{R}' \rangle = \mathcal{M}^t \langle \underline{\varrho}, \; \mathsf{R} \rangle \langle \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \; \rho \rangle \langle \mathsf{after}[\![\mathsf{S}]\!], \; \rho \rangle \rangle \right\}$
- $= \left\{ \langle \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \rho \rangle \langle \mathsf{after}[\![\mathsf{S}]\!], \rho \rangle, \mathsf{R}' \rangle \mid \langle \pi_2 \langle \mathsf{at}[\![\mathsf{S}]\!], \rho \rangle, \mathsf{R}'' \rangle \in \left\{ \langle \pi, \mathsf{R}'' \rangle \mid \pi \in X \land \langle \mathsf{tt}, \mathsf{R}'' \rangle = \mathcal{M}^t \langle \underline{\varrho}, \mathsf{R} \rangle \right\} \\ + \mathcal{B}[\![\mathsf{B}]\!] \rho = \mathsf{ff} \land \mathcal{M}^t \langle \varrho, \mathsf{R}'' \rangle \langle \langle \mathsf{at}[\![\mathsf{S}]\!], \rho \rangle \langle \mathsf{after}[\![\mathsf{S}]\!], \rho \rangle) = \langle \mathsf{tt}, \mathsf{R}' \rangle$

There are two subcases depending on whether $R'' \in \mathbb{R}_{\varepsilon}$ or not.

- If $R'' \in \mathbb{R}_s$, then
- $= \left\{ \langle \pi_2 \langle \operatorname{at}[\![\mathbf{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathbf{S}_b]\!], \, \rho \rangle \pi_3, \, \varepsilon \rangle \mid \langle \pi_2 \langle \operatorname{at}[\![\mathbf{S}]\!], \, \rho \rangle, \, \varepsilon \rangle \in \boldsymbol{\mathcal{M}}^{+} \langle \underline{\varrho}, \, \mathsf{R} \rangle X \wedge \boldsymbol{\mathcal{B}}[\![\mathbf{B}]\!] \, \rho = \operatorname{tt} \wedge \langle \operatorname{at}[\![\mathbf{S}_b]\!], \, \rho \rangle \langle \pi_3 \in \widehat{\boldsymbol{\mathcal{S}}}_{\,\, \mathbb{S}}^* [\![\mathbf{S}_b]\!] \right\} \\ \langle \operatorname{since} \, \mathsf{R}'' \in \mathcal{R}_{\varepsilon} \, \operatorname{and} \, \boldsymbol{\mathcal{M}}^t \langle \underline{\varrho}, \, \mathsf{R}'' \rangle (\langle \operatorname{at}[\![\mathbf{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathbf{S}_b]\!], \, \rho \rangle) = \langle \operatorname{tt}, \, \mathsf{R}''' \rangle \, \operatorname{imply} \, \operatorname{that} \, \mathsf{R}''' = \varepsilon \\ \operatorname{by} \, (44.24) \, \operatorname{and} \, \operatorname{so} \, \langle \langle \operatorname{at}[\![\mathbf{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \in \boldsymbol{\mathcal{M}}^+ [\![\mathbf{S}_b]\!] \langle \underline{\varrho}, \, \mathsf{R}''' \rangle = \{\langle \pi, \, \varepsilon \rangle \mid \pi \in \widehat{\boldsymbol{\mathcal{S}}}_{\,\, \mathbb{S}}^* [\![\mathbf{S}_b]\!] \} \, \operatorname{by} \\ (44.26) \, \operatorname{and} \, (44.25) \, \operatorname{implies} \, \mathsf{R}' = \varepsilon \, \operatorname{and} \, \langle \operatorname{at}[\![\mathbf{S}_b]\!], \, \rho \rangle \pi_3 \in \widehat{\boldsymbol{\mathcal{S}}}_{\,\, \mathbb{S}}^* [\![\mathbf{S}_b]\!] \}$
- Otherwise $R'' \notin R_{\varepsilon}$

```
 = \left\{ \langle \pi_2 \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \mid \langle \pi_2 \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle, \, \mathsf{R}'' \rangle \in \mathscr{M}^\dagger \langle \underline{\varrho}, \, \mathsf{R} \rangle X \wedge \mathscr{B}[\![\mathtt{B}]\!] \, \rho = \operatorname{tt} \wedge \mathsf{R}'' \notin \mathscr{R}_\epsilon \wedge \langle \mathsf{L} : \mathsf{B}, \mathsf{R}'''' \rangle = \operatorname{fstnxt}(\mathsf{R}'') \wedge \langle \underline{\varrho}, \, \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle \in \mathscr{S}^r [\![\mathtt{L} : \mathsf{B}]\!] \wedge \widetilde{\mathscr{M}}^t \langle \underline{\varrho}, \, \mathsf{R}'''' \rangle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle = \langle \operatorname{tt}, \, \mathsf{R}'''' \rangle \wedge \langle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \in \mathscr{M}^\dagger [\![\mathtt{S}_b]\!] \langle \varrho, \, \mathsf{R}''' \rangle \right\}
```

There are two subsubcases, depending on whether R"" is empty or not.

- If $R'''' \in \mathcal{R}_{\varepsilon}$ then, as shown before, $\mathcal{M}^t \langle \underline{\varrho}, R'''' \rangle \langle \operatorname{at}[\![S_b]\!], \rho \rangle = \langle \operatorname{tt}, R''' \rangle$ implies that $R''' \in \mathcal{R}_{\varepsilon}$ and so $\langle \langle \operatorname{at}[\![S_b]\!], \rho \rangle \pi_3$, $R' \rangle \in \mathcal{M}^+ [\![S_b]\!] \langle \underline{\varrho}, R''' \rangle$ if and only if $R' \in \mathcal{R}_{\varepsilon}$ and $\langle \operatorname{at}[\![S_b]\!], \rho \rangle \pi_3 \in \widehat{\mathcal{S}}^* [\![S_b]\!]$. We get
- $= \left\{ \langle \pi_2 \langle \operatorname{at}[\![\mathsf{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \pi_3, \, \varepsilon \rangle \mid \langle \pi_2 \langle \operatorname{at}[\![\mathsf{S}]\!], \, \rho \rangle, \, \mathsf{R}'' \rangle \in \mathscr{M}^{+} \langle \underline{\varrho}, \, \mathsf{R} \rangle X \wedge \mathscr{B}[\![\mathsf{B}]\!] \, \rho = \operatorname{tt} \wedge \mathsf{R}'' \notin \mathscr{R}_{\varepsilon} \wedge \langle \mathsf{L} : \mathsf{B}, \, \varepsilon \rangle = \operatorname{fstnxt}(\mathsf{R}'') \wedge \langle \underline{\varrho}, \, \langle \operatorname{at}[\![\mathsf{S}]\!], \, \rho \rangle \rangle \in \mathscr{S}^r[\![\mathsf{L} : \mathsf{B}]\!] \wedge \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \pi_3 \in \widehat{\mathscr{S}}^*_{s}[\![\mathsf{S}_b]\!] \right\}$ $\left\{ \langle 44.24 \rangle \right\}$
- Otherwise $R'''' \notin \mathbb{R}_{\varepsilon}$.
- $= \left\{ \langle \pi_2 \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \, \middle| \, \langle \pi_2 \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle, \, \mathsf{R}'' \rangle \in \mathscr{M}^\dagger \langle \underline{\varrho}, \, \mathsf{R} \rangle X \wedge \mathscr{B}[\![\mathtt{B}]\!] \, \rho = \operatorname{tt} \wedge \mathsf{R}'' \notin \mathscr{R}_{\varepsilon} \wedge \langle \mathsf{L} : \mathsf{B}, \, \mathsf{R}'''' \rangle = \operatorname{fstnxt}(\mathsf{R}'') \wedge \langle \underline{\varrho}, \, \langle \operatorname{at}[\![\mathtt{S}]\!], \, \rho \rangle \rangle \in \mathscr{S}^r[\![\mathtt{L} : \mathsf{B}]\!] \wedge \mathsf{R}'''' \notin \mathscr{R}_{\varepsilon} \wedge \mathscr{M}^t \langle \underline{\varrho}, \, \mathsf{R}'''' \rangle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle = \langle \operatorname{tt}, \, \mathsf{R}''' \rangle \wedge \langle \langle \operatorname{at}[\![\mathtt{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \in \mathscr{M}^\dagger [\![\mathtt{S}_b]\!] \langle \varrho, \, \mathsf{R}''' \rangle \}$
- $= \left\{ \langle \pi_2 \langle \operatorname{at}[\![\mathsf{S}]\!], \, \rho \rangle \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \, \middle| \, \langle \pi_2 \langle \operatorname{at}[\![\mathsf{S}]\!], \, \rho \rangle, \, \mathsf{R}'' \rangle \in \mathscr{M}^{\dagger} \langle \underline{\varrho}, \, \mathsf{R} \rangle X \wedge \mathscr{B}[\![\mathsf{B}]\!] \, \rho = \operatorname{tt} \wedge \mathsf{R}'' \notin \mathscr{R}_{\varepsilon} \wedge \langle \mathsf{L} : \mathsf{B}, \, \mathsf{R}'''' \rangle = \operatorname{fstnxt}(\mathsf{R}''') \wedge \langle \underline{\varrho}, \, \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \rangle \in \mathscr{S}^{\mathsf{r}} [\![\mathsf{L} : \mathsf{B}]\!] \wedge \mathsf{R}'''' \notin \mathscr{R}_{\varepsilon} \wedge \langle \mathsf{L}' : \mathsf{B}', \, \mathsf{R}''' \rangle + \left[\operatorname{fstnxt}(\mathsf{R}'''') \wedge \langle \underline{\varrho}, \, \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \rangle \in \mathscr{S}^{\mathsf{r}} [\![\mathsf{L}' : \mathsf{B}']\!] \wedge \langle \langle \operatorname{at}[\![\mathsf{S}_b]\!], \, \rho \rangle \pi_3, \, \mathsf{R}' \rangle \in \mathscr{M}^{\dagger} [\![\mathsf{S}_b]\!] \langle \underline{\varrho}, \, \mathsf{R}''' \rangle \right\}$
- Grouping all cases together we get the term (44.50) defining $\widehat{\mathcal{F}}^{\dagger}[S]\langle \varrho, R \rangle$ ($\mathcal{M}^{\dagger}\langle \varrho, R \rangle X$) and so Corollary 18.31 and the commutation condition $\mathcal{M}^{\dagger}\langle \varrho, R \rangle (\mathcal{F}_{\mathbb{S}}^{*}[S](X)) = \widehat{\mathcal{F}}^{\dagger}[S]\langle \varrho, R \rangle$ ($\mathcal{M}^{\dagger}\langle \varrho, R \rangle (X)$) for the iterates X of $\mathcal{F}_{\mathbb{S}}^{*}[S]$ yield $\widehat{\mathcal{M}}^{\dagger}[S]\langle \varrho, R \rangle \triangleq |\mathsf{ffp}^{\varsigma}(\widehat{\mathcal{F}}^{\dagger}[S]\langle \varrho, R \rangle)$ that is (44.49).
- In case (44.48) of a break statement $S := \ell$ break;

$$\mathcal{M}^{\dagger} \llbracket \mathsf{S} \rrbracket \langle \varrho, \mathsf{R} \rangle$$

- $= \left\{ \langle \pi, R' \rangle \mid \pi \in \widehat{\mathcal{S}}_{s}^{*}[\![s]\!] \land \langle \mathsf{tt}, R' \rangle = \mathcal{M}^{t} \langle \varrho, R \rangle \pi \right\}$ (44.26) and (44.25))
- $= \{\langle \pi, \mathsf{R}' \rangle \mid \pi \in \{\langle \ell, \rho \rangle \mid \rho \in \mathbb{E} \mathsf{v}\} \cup \{\langle \ell, \rho \rangle \langle \mathsf{break-to}[\![\mathsf{S}]\!], \rho \rangle \mid \rho \in \mathbb{E} \mathsf{v}\} \land \langle \mathsf{tt}, \mathsf{R}' \rangle = \mathcal{M}^t \langle \underline{\rho}, \mathsf{R} \rangle \pi \}$ (42.14)
- $= \left\{ \langle \langle \ell, \rho \rangle, R'' \rangle \mid \langle \mathsf{tt}, R'' \rangle = \mathcal{M}^t \langle \underline{\rho}, R \rangle \langle \ell, \rho \rangle \right\} \cup \left\{ \langle \langle \ell, \rho \rangle \langle \mathsf{break-to}[\![\mathsf{S}]\!], \rho \rangle, R'' \rangle \mid \langle \mathsf{tt}, R'' \rangle = \mathcal{M}^t \langle \underline{\rho}, R \rangle \langle \ell, \rho \rangle \langle \mathsf{break-to}[\![\mathsf{S}]\!], \rho \rangle \right\}$ $\left\{ \langle \ell, \rho \rangle \langle \mathsf{break-to}[\![\mathsf{S}]\!], \rho \rangle \right\}$

```
= let \langle L : B, R' \rangle = fstnxt(R) in \{\langle \langle \ell, \rho \rangle, R' \rangle \mid \langle \underline{\varrho}, \langle \ell, \rho \rangle \rangle \in \mathcal{S}^r \llbracket L : B \rrbracket \} \cup \{\langle \langle \ell, \rho \rangle \langle \text{break-to} \llbracket S \rrbracket, \rho \rangle, \varepsilon \rangle \mid R' \in \mathcal{R}_{\varepsilon} \land \langle \underline{\varrho}, \langle \ell, \rho \rangle \rangle \in \mathcal{S}^r \llbracket L : B \rrbracket \} \cup \{\langle \langle \ell, \rho \rangle \langle \text{break-to} \llbracket S \rrbracket, \rho \rangle, R'' \rangle \mid R' \notin \mathcal{R}_{\varepsilon} \land \langle \underline{\varrho}, \langle \ell, \rho \rangle \rangle \in \mathcal{S}^r \llbracket L : B \rrbracket \land \langle L' : B', R'' \rangle = \text{fstnxt}(R') \land \langle \underline{\varrho}, \langle \text{break-to} \llbracket S \rrbracket, \rho \rangle \rangle \in \mathcal{S}^r \llbracket L' : B' \rrbracket \}

In words for that first case, the initial value of x' flows to the value of x' by the false branch of the conditional if (B) S_t when there are at least two different values of x' for which B is false. (If

there is only one, x' is constant on the false branch. This can be disproved by a constancy analysis [DBLP:conf/popl/Kildall73, DBLP:journals/toplas/WegmanZ91, DBLP:journals/acta/Karr76, DBLP:conf/cc/KnoopKS98, DBLP:conf/cc/KnoopR00, DBLP:conf/esop/Muller-OlmR01] or a determinacy analysis [DBLP:journals/ngc/Lopez-GarciaBH10, DBLP:journals/corr/abs-1905-06544].) A classical coarser over-approximation is to ignore values *i.e.* that variables may have only one value making the test false.

- (2.b) - Else, if both executions π_0 at $[S]\pi_1$ after [S] and π'_0 at $[S]\pi'_1$ after [S] are through the true branch, we have,

(??)

In words, the initial value of x' flows to the value of y at ℓ in the true branch S_t of the conditional if (B) S_t when there are at least two different values of x' for which B is true and x' flows to the value of y at ℓ in S_t .

 $\subseteq \mathcal{S}^{\operatorname{d}} \llbracket \mathsf{S}_t \rrbracket \ \ell$

(A coarse over-approximation ignoring values *i.e.* that the conditional holds for only one value of x' \

Proof of (47.63) By Lemma 47.23, the Definition 47.28 of value dependency using the maximal traces semantics is equivalent to the definition of value dependency for finite prefix traces, as defined by (17.4). So the soundness of (47.63) follows from the following (??):

$$\alpha^{\mathbf{d}}(\mathcal{S}^{*}[[\mathbf{S}]]) = \alpha^{\mathbf{d}}(\mathsf{lfp}^{\varsigma}\mathcal{F}^{*}[[\mathbf{while}\,^{\ell}(\mathbf{B})\,\mathbf{S}_{b}]])$$

$$\dot{\subseteq} \mathsf{lfp}^{\varsigma}\mathcal{F}^{\mathsf{diff}}[[\mathbf{while}\,^{\ell}(\mathbf{B})\,\mathbf{S}_{b}]] = \widehat{\mathcal{S}}_{\mathsf{diff}}^{\exists}[[\mathbf{S}]]$$
(3)

The proof of (??) is an application of Exercise 18.17. $\langle C, \sqsubseteq, \bot, \sqcup \rangle$ is the complete lattice $\langle \wp(\wp(\mathbb{T}^+ \times \mathbb{T}^{+\infty})), \subseteq, \varnothing, \cup \rangle$. $\langle \mathcal{A}, \prec, 0, \vee \rangle$ is the complete lattice $\langle \mathbb{P}^d, \subseteq^d, \bot^d, \cup^d \rangle$. The Galois connection $\langle C, \sqsubseteq \rangle \xrightarrow[\alpha]{\gamma} \langle \mathcal{A}, \prec \rangle$ is given by Lemma 47.26. The transformer f is (17.4). It preserves arbitrary non-empty unions so it is continuous. The transformer g is (47.63). It preserves arbitrary non-empty unions pointwise so it is pointwise continuous (*i.e.* for \subseteq^d and \cup^d defined pointwise). The main point of the proof is to check the semi-commutation condition

$$\alpha^{\mathbf{d}} \circ \mathcal{F}^* \llbracket \mathsf{while} \, \ell \; (\mathsf{B}) \; \mathsf{S}_b \rrbracket \; \stackrel{.}{\subseteq} \; \mathcal{F}^{\mathsf{diff}} \llbracket \mathsf{while} \, \ell \; (\mathsf{B}) \; \mathsf{S}_b \rrbracket \circ \alpha^{\mathsf{d}} \,.$$
 (4)

By Exercise 18.17, we need to make the proof only for elements $X \in \mathcal{X}$ where \mathcal{X} is chosen to be exactly the iterates of the transformer $\mathcal{F}^*[\![\text{while}\ ^\ell\ (B)\ S_b]\!]$ from \emptyset .

In practice, we have discovered $\mathcal{F}^{\text{diff}}[\![\text{while }\ell\ (B)\ S_b]\!]$ knowing $\mathcal{F}^*[\![\text{while }\ell\ (B)\ S_b]\!]$ and α^d by rewriting until getting a formula of the form $\mathcal{F}^{\text{diff}}[\![\text{while }\ell\ (B)\ S_b]\!] \circ \alpha^d$ and using $\dot{\subseteq}$ -overapproximations to ignore values in the static analysis. By Exercise 18.17, we conclude that

$$\alpha^{\operatorname{d}}(\mathsf{lfp}^{\varsigma}\, \boldsymbol{\mathcal{F}}^*[\![\mathsf{while}\,\,{}^{\ell}\,\,(\mathsf{B})\,\,\mathsf{S}_b]\!]) \stackrel{.}{\subseteq} \mathsf{lfp}^{\varsigma}\, \boldsymbol{\mathcal{F}}^{\operatorname{diff}}[\![\mathsf{while}\,\,{}^{\ell}\,\,(\mathsf{B})\,\,\mathsf{S}_b]\!]\,.$$

The proof of semi-commutation (??) is by calculational design as follows. By def. (47.18) of diff, we do not have to compare futures of prefix traces where one is a prefix of the other.

```
\alpha^{\mathfrak{q}}(\{\mathscr{F}^{*}[\![\mathsf{while}\,^{\ell}(\mathsf{B})\,\mathsf{S}_{b}]\!]\,X\})\,^{\ell'}\\ = \{\langle\mathsf{x},\,\mathsf{y}\rangle\,|\,\,\mathscr{F}^{*}[\![\mathsf{while}\,^{\ell}(\mathsf{B})\,\mathsf{S}_{b}]\!]\,X\in\mathcal{D}(\ell')\langle\mathsf{x},\,\mathsf{y}\rangle\} \qquad \qquad \big\langle \mathrm{def.}\,(47.25)\,\mathrm{of}\,\alpha^{\mathfrak{q}}\big\rangle\\ = \{\langle\mathsf{x},\,\mathsf{y}\rangle\,|\,\,\exists\langle\pi_{0},\,\pi_{1}\rangle,\langle\pi_{0}',\,\pi_{1}'\rangle\in\,\mathscr{F}^{*}[\![\mathsf{while}\,^{\ell}(\mathsf{B})\,\mathsf{S}_{b}]\!]\,X\,\,.\,\,(\forall\mathsf{z}\in\mathscr{V}\setminus\{\mathsf{x}\}\,.\,\varrho(\pi_{0})\mathsf{z}=\varrho(\pi_{0}')\mathsf{z})\,\wedge\\ \mathrm{diff}(\mathsf{seqval}[\![\mathsf{y}]\!]\ell'(\pi_{0},\pi_{1}),\mathsf{seqval}[\![\mathsf{y}]\!]\ell'(\pi_{0}',\pi_{1}'))\} \qquad \qquad \big\langle \mathrm{def.}\,(47.19)\,\mathrm{of}\,\mathcal{D}^{\ell}\langle\mathsf{x},\,\mathsf{y}\rangle\big\rangle\\ = \{\langle\mathsf{x},\,\mathsf{y}\rangle\,|\,\,\,\exists\langle\pi_{0}^{\ell},\,\ell\pi_{1}\rangle,\langle\pi_{0}'^{\ell},\,\ell\pi_{1}'\rangle\in\,\mathscr{F}^{*}[\![\mathsf{while}\,^{\ell}(\mathsf{B})\,\mathsf{S}_{b}]\!]\,X\,\,.\,\,(\forall\mathsf{z}\in\mathscr{V}\setminus\{\mathsf{x}\}\,\,.\\ \varrho(\pi_{0}^{\ell})\mathsf{z}=\varrho(\pi_{0}'^{\ell})\mathsf{z})\,\wedge\,\,\mathrm{diff}(\mathsf{seqval}[\![\mathsf{y}]\!]\ell'(\pi_{0}^{\ell},\ell\pi_{1}),\mathsf{seqval}[\![\mathsf{y}]\!]\ell'(\pi_{0}'^{\ell},\ell\pi_{1}'))\}\\ \big\langle\mathsf{since}\,\langle\pi_{0}^{\ell}\ell,\,\ell''\pi_{1}\rangle\,\notin\,\mathscr{F}^{*}[\![\mathsf{while}\,^{\ell}(\mathsf{B})\,\mathsf{S}_{b}]\!](X)\,\,\mathrm{when}\,\ell'\neq\ell\,\,\mathrm{or}\,\ell''\neq\ell\big\rangle\\ \end{aligned}
```

There are three main cases depending on whether the dependency observation point ℓ' is (1) at the iteration (so $\ell' = \ell = \text{at}[\text{while } \ell \text{ (B) } S_b]$), (2) is in the loop body (so $\ell' \in \text{in}[S_b]$), or (3) is after the iteration (so $\ell' = \text{after}[\text{while } \ell \text{ (B) } S_b]$).

For each of these case, we have to consider all possible ways the traces $\ell \pi_1$ and $\ell \pi'_1$ in (??) can go through the dependency observation program point ℓ' . The definition of \mathcal{F}^* below shows all possible choices (A), (B), or (C) of $\ell \pi_1$ and $\ell \pi'_1$ in (??). Notice that diff in (47.16) is commutative so $\langle \pi_0 \ell, \ell \pi_1 \rangle$ and $\langle \pi'_0 \ell, \ell \pi'_1 \rangle$ play symmetric rôles in (??) which reduces the number of cases to be considered.

$$\mathcal{F}^*[\text{while } \ell \text{ (B) } S_b](X) \triangleq \{\langle \pi_0 \ell, \ell \rangle\}$$
 (A) (17.4)

$$\cup \left\{ \langle \pi_0 ^{\ell}, \ ^{\ell} \pi_2 ^{\ell} \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3 ^{\ell''} \rangle \ \middle| \ \langle \pi_0 ^{\ell}, \ ^{\ell} \pi_2 ^{\ell} \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^{\ell} \pi_2 ^{\ell}) = \mathsf{tt} \right. \tag{B}$$

$$\wedge \ \langle \pi_0^{}\ell \pi_2^{}\ell \xrightarrow{\;\;\mathsf{B}\;\;} \mathsf{at} [\![\mathsf{S}_b]\!], \ \mathsf{at} [\![\mathsf{S}_b]\!] \pi_3^{\ell''} \rangle \in \mathcal{S}^* [\![\mathsf{S}_b]\!] \}$$

$$\cup \left\{ \langle \pi_0 ^\ell, \ \ell \pi_2 ^\ell \xrightarrow{\neg (\mathsf{B})} \mathsf{after} \llbracket \mathsf{S} \rrbracket \rangle \ \middle| \ \langle \pi_0 ^\ell, \ \ell \pi_2 ^\ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell \pi_2 ^\ell) = \mathsf{ff} \right\} \tag{C}$$

The case (B) covers essentially 3 subcases depending of where is ℓ'' that is where the prefix observation at $[S_b]\pi_3\ell''$ of the execution of the body S_b has terminated:

- **(Ba)** within the loop body $\ell'' \in \inf[S_h]$;
- **(Bb)** after the loop body $\ell'' = \text{after}[S_b] = \text{at}[S] = \ell$, because of the normal termination of the loop body, and thus at ℓ , just before the next iteration or the loop exit;
- (Bc) after the loop $\ell'' = \text{after}[S]$ because of a break; statement in the loop body S_h ;
- (1) If the dependency observation point ℓ' is at loop entry then $\ell' = \ell = \text{at}[\text{while } \ell \text{ (B) } S_b]$. There are three subcases, depending on how $\ell' = \ell$ is reached $\ell \pi_1$ by (A), (B), or (C) of $\ell \pi_1$ and $\ell \pi'_1$ in (??).
- (1–A) In the first case $\ell \pi_1 = \ell$ so $\pi_1 = \ni$ in (A). We have seqval $[\![y]\!]\ell'(\pi_0\ell,\ell) = \varrho(\pi_0\ell)y$ by (47.16). Whether $\ell \pi_1'$ is determined by (A), (B), or (C) we have in all cases that seqval $[\![y]\!]\ell'(\pi_0'\ell,\ell\pi_1') = \varrho(\pi_0'\ell) \cap \sigma$ where σ is a possibly empty sequence of values of y at $\ell' = \ell$. By def. (47.18) of diff, we dont't care about σ since diff(seqval $[\![y]\!]\ell'(\pi_0\ell,\ell\pi_1)$, seqval $[\![y]\!]\ell'(\pi_0'\ell,\ell\pi_1')$) is true if and only if $\varrho(\pi_0\ell)y \neq \varrho(\pi_0'\ell)$. In that case, we have

(§§)

$$= \{\langle \mathbf{x}, \ \mathbf{y} \rangle \mid \exists \langle \pi_0 \ell, \ \ell \pi_1 \rangle, \langle \pi_0' \ell, \ \ell \pi_1' \rangle \in \boldsymbol{\mathcal{F}}^* \llbracket \mathbf{while} \ \ell \ (\mathbf{B}) \ \mathbf{S}_b \rrbracket \ X \ . \ (\forall \mathbf{z} \in V \setminus \{\mathbf{x}\} \ . \ \boldsymbol{\varrho}(\pi_0 \ell) \mathbf{z} = \boldsymbol{\varrho}(\pi_0' \ell) \mathbf{z}) \wedge \boldsymbol{\varrho}(\pi_0 \ell) \mathbf{y} \neq \boldsymbol{\varrho}(\pi_0 \ell) \mathbf{y} \}$$

$$\subseteq \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \pi_0^{\ell}, \pi_0'^{\ell} \cdot (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} \cdot \varrho(\pi_0^{\ell}) \mathsf{z} = \varrho(\pi_0'^{\ell}) \mathsf{z}) \land (\varrho(\pi_0^{\ell}) \mathsf{y} \neq \varrho(\pi_0'^{\ell}) \mathsf{y})\} \qquad \text{ℓ def. } \subseteq \}$$

$$= \{ \langle \mathsf{x}, \, \mathsf{y} \rangle \mid \exists \rho, \nu \, . \, \rho(\mathsf{y}) \neq \rho[\mathsf{x} \leftarrow \nu](\mathsf{y}) \}$$

letting
$$\rho = \varrho(\pi_0 \ell)$$
, $\rho[x \leftarrow v] = \varrho(\pi'_0 \ell)$ and Exercise 6.8

=
$$\{\langle x, x \rangle \mid x \in V\}$$
 \(\lambda\) def. (19.10) of the environment assignment\(\rangle\)

```
— (1-Ba/Bc/C) In this second case the trace \ell \pi_1 corresponds to one or more iterations of the
loop followed by an execution of the loop body or a loop exit.
- In case (Ba), we have
              seqval\llbracket y \rrbracket \ell'(\pi_0 \ell, \ell \pi_1)
= \operatorname{seqval}[\![y]\!] \ell'(\pi_0\ell,\ell\pi_2\ell \xrightarrow{\mathsf{B}} \operatorname{at}[\![\mathsf{S}_b]\!] \pi_3\ell'') \text{ where } \langle \pi_0\ell,\ \ell\pi_2\ell \rangle \ \in \ X \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \ \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0\ell\pi_2\ell) \ = \ \operatorname{tt} \ \land \

 $\langle def. identity relation on the set V of variables in Section 2.2.2 \rangle$

abstracting away the value of the conditions \

 $\varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0^\prime \ell) \mathsf{z}) \wedge \mathsf{diff}(\mathsf{seqval}[\![\mathsf{y}]\!] \ell^\prime(\pi_0^\ell, \ell \pi_2^\ell), \mathsf{seqval}[\![\mathsf{y}]\!] \ell^\prime(\pi_0^\prime \ell, \ell \pi_1^\prime)) \}$

The possible choices for $\langle \pi'_0 \ell, \ell \pi'_1 \rangle \in \mathcal{F}^*[\text{while } \ell \text{ (B) } S_b] X$ are given by (A), (B), and (C) and are considered below.

- (1-Ba/Bc/C-A) This case is the symmetric of (1-A), and so has already bean considered.
- (1-Ba/Bc/C-Ba/Bc/C) In this case the above reasoning that we have done in (1-Ba/Bc/C) for the first trace $\ell \pi_1$ is also valid for the second trace $\ell \pi_1'$, and so we get

(??)

- $= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0^\ell, \ell \pi_2^\ell \rangle \in X : \exists \langle \pi_0'^\ell, \ell \pi_1' \rangle \in \mathscr{F}^* \llbracket \mathsf{while} \ \ell \ (\mathsf{B}) \ \mathsf{S}_b \rrbracket X : (\forall \mathsf{z} \in \mathbb{V} \setminus \{\mathsf{x}\} : \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \land \mathsf{diff}(\mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell'(\pi_0^\ell, \ell \pi_2^\ell), \mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell'(\pi_0'^\ell, \ell \pi_1')) \}$
- $\leq \{\langle \mathsf{x}, \, \mathsf{y} \rangle \mid \exists \langle \pi_0^\ell, \, \ell \pi_2^\ell \rangle \in X \; . \; \exists \langle \pi_0'^\ell, \, \ell \pi_2'^\ell \rangle \in X \; . \; (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} \; . \; \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \land \\ \mathsf{diff}(\mathsf{seqval}[\![\![\mathsf{y}]\!]^{\ell'}(\pi_0^\ell, \ell \pi_2^\ell), \mathsf{seqval}[\![\![\![\mathsf{y}]\!]^{\ell'}(\pi_0'^\ell, \ell \pi_2'^\ell))\}$

abstracting away the value of the conditions)

 $\subseteq \{\langle \mathsf{x}, \ \mathsf{y} \rangle \mid \exists \langle \pi_0, \ \pi_1 \rangle, \langle \pi_0', \ \pi_1' \rangle \in X \quad . \quad (\forall \mathsf{z} \in \mathbb{V} \setminus \{\mathsf{x}\} \quad . \quad \varrho(\pi_0) \mathsf{z} = \varrho(\pi_0') \mathsf{z}) \land \mathsf{diff}(\mathsf{seqval}[\![\mathsf{y}]\!]^\ell(\pi_0, \pi_1), \mathsf{seqval}[\![\mathsf{y}]\!]^\ell(\pi_0', \pi_1'))\}$

(letting
$$\pi_0 \leftarrow \pi_0 \ell$$
, $\pi_1 \leftarrow \ell \pi_2 \ell$, $\pi'_0 \leftarrow \pi'_0 \ell$, $\pi'_1 \leftarrow \ell \pi'_2 \ell$, and $\ell' = \ell$ in case (1))

 $= \{\langle \mathsf{x}, \ \mathsf{y} \rangle \mid X \in \{\Pi \in \wp(\mathbb{T}^+ \times \mathbb{T}^{+\infty}) \mid \exists \langle \pi_0, \ \pi_1 \rangle, \langle \pi_0', \ \pi_1' \rangle \in \Pi : (\forall \mathsf{z} \in \mathbb{V} \setminus \{\mathsf{x}\} : \varrho(\pi_0)\mathsf{z} = \varrho(\pi_0')\mathsf{z}) \land \mathsf{diff}(\mathsf{seqval}[\![\mathsf{y}]\!]^\ell(\pi_0, \pi_1), \mathsf{seqval}[\![\mathsf{y}]\!]^\ell(\pi_0', \pi_1'))\}\}$ $\langle \mathsf{def}. \in \mathcal{G}$

$$= \{\langle \mathsf{x}, \, \mathsf{y} \rangle \mid X \in \mathcal{D}^{\ell} \langle \mathsf{x}, \, \mathsf{y} \rangle\}$$

$$= \alpha^{4}(\lbrace X \rbrace)^{\varrho} \qquad \qquad (\text{def. } (47.25) \text{ of } \alpha^{4})$$

- (1-Ba/Bc/C-Bb) In this case we are in case (1-Ba/Bc/C) for the first prefix observation trace $\ell \pi_1$ corresponding to one or more iterations of the loop followed by an execution of the loop body or a loop exit and in case Bb for the second trace $\ell \pi'_1$ so that, after zero or more executions, the loop body has terminated normally at $\ell'' = \text{after}[S_b] = \text{at}[S] = \ell$ and the prefix observation stops there, just before the next iteration or the loop exit. We have

(??)

 $= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0^\ell, \ell \pi_2^\ell \rangle \in X : \exists \langle \pi_0'^\ell, \ell \pi_1' \rangle \in \mathscr{F}^* \llbracket \mathsf{while} \ \ell \ (\mathsf{B}) \ \mathsf{S}_b \rrbracket X : (\forall \mathsf{z} \in \mathbb{V} \backslash \{\mathsf{x}\} : \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \land \mathsf{diff}(\mathsf{seqval} \llbracket \mathsf{y} \rrbracket^\ell(\pi_0^\ell, \ell \pi_2^\ell), \mathsf{seqval} \llbracket \mathsf{y} \rrbracket^\ell(\pi_0'^\ell, \ell \pi_1')) \}$

$$\frac{1}{2}$$

- $= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0^\ell, \ell \pi_2^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at}[\![\mathsf{S}_b]\!] \pi_3^\ell \rangle \cdot \langle \pi_0^\ell, \ell \pi_2^\ell \rangle \in X \land \langle \pi_0^\ell \pi_2^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at}[\![\mathsf{S}_b]\!], \mathsf{at}[\![\mathsf{S}_b]\!] \pi_3^\ell \rangle \in \{\langle \pi, \pi' \rangle \in \mathcal{S}^*[\![\mathsf{S}_b]\!] \mid \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi) \} \land \exists \langle \pi'_0^\ell, \ell \pi'_2^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at}[\![\mathsf{S}_b]\!] \pi'_3^\ell \rangle \cdot \langle \pi'_0^\ell, \ell \pi'_2^\ell \rangle \in X \land \langle \pi'_0^\ell \ell \pi'_2^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at}[\![\mathsf{S}_b]\!], \mathsf{at}[\![\mathsf{S}_b]\!] \pi'_3^\ell \rangle \in \{\langle \pi, \pi' \rangle \in \mathcal{S}^*[\![\mathsf{S}_b]\!] \mid \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi) \} \land (\forall \mathsf{z} \in \mathcal{V} \setminus \{\mathsf{x}\} \cdot \varrho(\pi'_0^\ell) \mathsf{z} = \varrho(\pi'_0^\ell) \mathsf{z}) \land \mathsf{diff}(\mathsf{seqval}[\![\mathsf{y}]\!] \ell(\pi_0^\ell, \ell \pi_2^\ell), \mathsf{seqval}[\![\mathsf{y}]\!] \ell(\pi'_0^\ell, \ell \pi'_2^\ell)) \}$
 - (by def. (47.18) of diff, and def. (47.16) of seqval [[y]] since in case (1), $\ell' = \ell$ does not appear in $\stackrel{\mathsf{B}}{\longrightarrow}$ at $[\![\mathsf{S}_b]\!] \pi_3$ and the value of y is the same at ℓ after $\pi_0 \ell \pi_2 \ell \stackrel{\mathsf{B}}{\longrightarrow}$ at $[\![\mathsf{S}_b]\!] \pi_3 \ell$ and at ℓ after $\pi_0 \ell \pi_2 \ell$. Same for $\pi'_0 \ell \pi'_2 \ell \stackrel{\mathsf{B}}{\longrightarrow}$ at $[\![\mathsf{S}_b]\!] \pi'_3 \ell$. \mathcal{S}

— Summing up for case (1) we get $(??) \subseteq \mathbb{1}_V \cup \alpha^4(\{X\})^{\ell} \cup (\alpha^4(\{X\})^{\ell}, \widehat{\overline{S}}_{\text{diff}}^{\exists} \llbracket s_b \rrbracket \ell) \rceil$ nondet(B, B) which yields (47.63.a) of the form

However, the term $X(\ell)$ does not appear in (47.63.a) since it can be simplified thanks to Exercise 15.8.

— (2) Else, if the dependency observation point ℓ' on prefix traces is in the loop body S_b after zero or more loop iterations. So the two traces $\ell\pi_1$ and $\ell\pi'_1$ in (??) cannot be generated by (17.4.A). The case $\ell' = \ell$ = after $[S_b] = at[S]$ has already been considered in case (1) (for subcases involving (B) and (C)). By def. (47.16) of seqval [y] the case $\ell' = at[S_b]$ is equivalent to $\ell' = at[S]$ already considered in (1) since the evaluation of boolean expressions has no side effect so the value of variables y at $at[S_b]$ and at[S] are the same. Similarly, the value of variables y before a **break**; statement at labels in breaks-of $[S_b]$ that can escape the loop body S_b is the same as the value at break-to $[S_b] = after [S]$ and will be handled with case (3).

It follows that in this case (2) we only have to consider the case $\ell' \in \inf[S_b] \setminus (\{at[S_b], after[S_b]\} \cup breaks-of[S_b])$ and the two traces $\ell \pi_1$ and $\ell \pi'_1$ in(??) are generated by (B) or (C). There are three cases to consider.

— (2–B–B) The dependency observation point ℓ' on the two prefix observation traces $\ell \pi_1$ and $\ell \pi'_1$ in (??) is in the loop body S_b after zero or more loop iterations and the observation along these two traces stops in the loop body.

(by def. (47.18) of diff and (47.16) of seqval $[y]^{\ell'}$, there is an instance of ℓ' in both $\ell \pi'_2 \ell \xrightarrow{\mathsf{B}} \mathsf{at} [S_b] \pi'_3 \ell''$ and $\ell \pi'_2 \ell \xrightarrow{\mathsf{B}} \mathsf{at} [S_b] \pi'_3 \ell''$ before which the values of y at ℓ' and at which they differ. There are four cases (indeed 3 by symmetry), depending on whether the occurrence of ℓ'' is before or after the transition $\xrightarrow{\mathsf{B}}$.

 $\subseteq \alpha^{\mathfrak{q}}(\{X\})\ell' \cup$

 $\{\langle \mathbf{x},\,\mathbf{y}\rangle \mid \exists \langle \pi_0^{\ell},\, \ell\pi_2^{\ell} \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi_3^{\ell''} \rangle \; . \; \langle \pi_0^{\ell},\, \ell\pi_2^{\ell} \rangle \in X \land \langle \pi_0^{\ell}\pi_2^{\ell} \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket, \; \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi_3^{\ell''} \rangle \in \{\langle \pi,\,\pi' \rangle \in \mathcal{S}^* \llbracket \mathbf{S}_b \rrbracket \mid \mathcal{B} \llbracket \mathbf{B} \rrbracket \varrho(\pi) \} \land \exists \langle \pi'_0^{\ell},\, \ell\pi'_2^{\ell} \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi'_3^{\ell''} \rangle \; . \; \langle \pi'_0^{\ell},\, \ell\pi'_2^{\ell} \rangle \in X \land \langle \pi'_0^{\ell}\pi'_2^{\ell} \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket, \; \mathsf{at} \llbracket \mathbf{S}_b \rrbracket, \; \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi'_3^{\ell''} \rangle \in \{\langle \pi,\,\pi' \rangle \in \mathcal{S}^* \llbracket \mathbf{S}_b \rrbracket \mid \mathcal{B} \llbracket \mathbf{B} \rrbracket \varrho(\pi) \} \land (\forall \mathbf{z} \in \mathcal{V} \setminus \{\mathbf{x}\} \; . \\ \varrho(\pi_0^{\ell})\mathbf{z} = \varrho(\pi'_0^{\ell}\ell)\mathbf{z}) \land \mathsf{diff}(\mathsf{seqval} \llbracket \mathbf{y} \rrbracket \ell'(\pi_0^{\ell}\ell,\ell\pi_2^{\ell}\ell \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi_3^{\ell''}), \mathsf{seqval} \llbracket \mathbf{y} \rrbracket \ell'(\pi'_0^{\ell}\ell,\ell\pi'_2^{\ell}\ell \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathbf{S}_b \rrbracket \pi'_3^{\ell''})) \}$

(For the second term where ℓ' occurs in $\ell \pi_2 \ell$, the trace $\ell \pi_2 \ell$ must have reached the loop body, and so, by the reasoning of (??), this second term is an instance of the third one.

$$\subseteq \alpha^{\mathsf{d}}(\{X\})^{\ell'} \cup \left(\alpha^{\mathsf{d}}(\{X\})^{\ell} \circ ((\widehat{\overline{\mathcal{S}}}_{\mathsf{diff}}^{\exists} \llbracket \mathsf{S}_h \rrbracket \ell') \rceil \mathsf{nondet}(\mathsf{B},\mathsf{B}))\right)$$

(by a reasoning similar to the one we did in case (1-Ba/Bc/C-Bb) from (??) on.

— (2–B–C/2–C–B) The dependency observation point ℓ' on the two prefix observation traces $\ell \pi_1$ and $\ell \pi'_1$ in (??) is in the loop body S_h after zero or more loop iterations and the observation

along these two traces stops in the loop body for one and at the loop exit for the other.

(??)

 $= \{\langle \mathsf{x},\,\mathsf{y}\rangle \mid \exists \langle \pi_0 ^\ell,\, \ell \pi_1 \rangle \in \big\{\langle \pi_0 ^\ell,\, \ell \pi_2 ^\ell \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathsf{s}_b \rrbracket \pi_3 ^{\ell''} \rangle \mid \langle \pi_0 ^\ell,\, \ell \pi_2 ^\ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell \pi_2 ^\ell) = \\ \text{tt} \land \langle \pi_0 ^\ell \pi_2 ^\ell \xrightarrow{\mathsf{B}} \mathsf{at} \llbracket \mathsf{s}_b \rrbracket,\, \mathsf{at} \llbracket \mathsf{s}_b \rrbracket \pi_3 ^{\ell''} \rangle \in \mathscr{S}^* \llbracket \mathsf{s}_b \rrbracket \big\} \; . \; \exists \langle \pi_0 ^\ell \ell,\, \ell \pi_1 ^\ell \rangle \in \big\{\langle \pi_0 ^\ell,\, \ell \pi_2 ^\ell \ell \xrightarrow{\neg (\mathsf{B})} \\ \text{after} \llbracket \mathsf{S} \rrbracket \rangle \mid \langle \pi_0 ^\ell,\, \ell \pi_2 ^\ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell \pi_2 ^\ell) = \mathrm{ff} \big\} \; . \; (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} \; . \; \varrho (\pi_0 ^\ell) \mathsf{z} = \varrho (\pi_0 ^\ell) \mathsf{z}) \land \\ \text{diff} (\mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell' (\pi_0 ^\ell, \ell \pi_1), \mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell' (\pi_0 ^\ell, \ell \pi_1')) \} \qquad \qquad (\mathsf{case} \; 2-\mathsf{B}-\mathsf{C})$

$$\subseteq \alpha^{\mathrm{d}}(\{X\})^{\ell'} \cup \left(\alpha^{\mathrm{d}}(\{X\})^{\ell} \circ ((\widehat{\overline{\mathcal{S}}}_{\mathrm{diff}}^{\exists} \llbracket \mathsf{S}_{h} \rrbracket \ \ell') \ \rceil \ \mathsf{nondet}(\mathsf{B},\mathsf{B}))\right)$$

(This case is handled exactly as the previous one since the program point ℓ' where the change of value of variable y is observed is within the loop body so the loop must be entered in part $\ell \pi_2 \ell$ of $\ell \pi_2 \ell \xrightarrow{\neg (B)}$ after $\llbracket S \rrbracket$ and the loop exit $\ell \xrightarrow{\neg (B)}$ after $\llbracket S \rrbracket$ does not affect the variable y.)

— (2–C–C) The dependency observation point ℓ' on the two prefix observation traces $\ell \pi_1$ and $\ell \pi'_1$ in (??) is in the loop body S_b after zero or more loop iterations and the observation along these two traces stops at the loop exit.

(??)

$$= \{\langle \mathsf{x}, \ \mathsf{y} \rangle \mid \exists \langle \pi_0 ^\ell, \ ^\ell \pi_1 \rangle, \langle \pi_0 ^\prime ^\ell, \ ^\ell \pi_1 ^\prime \rangle \in \{\langle \pi_0 ^\ell, \ ^\ell \pi_2 ^\ell \xrightarrow{\neg (\mathsf{B})} \ \mathsf{after} \llbracket \mathsf{S} \rrbracket \rangle \mid \langle \pi_0 ^\ell, \ ^\ell \pi_2 ^\ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell \pi_2 ^\ell) = \mathsf{ff} \} . \quad (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} . \quad \varrho (\pi_0 ^\ell) \mathsf{z} = \varrho (\pi_0 ^\ell) \mathsf{z}) \land \mathsf{diff} (\mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell' (\pi_0 ^\ell, \ell \pi_1), \mathsf{seqval} \llbracket \mathsf{y} \rrbracket \ell' (\pi_0 ^\ell, \ell \pi_1')) \}$$

$$\subseteq \alpha^{\mathrm{d}}(\{X\})^{\ell'} \cup \left(\alpha^{\mathrm{d}}(\{X\})^{\ell} \circ (\widehat{\overline{\mathcal{S}}}_{\mathrm{diff}}^{\exists} \llbracket \mathsf{S}_{h} \rrbracket \ell') \mid \mathsf{nondet}(\mathsf{B},\mathsf{B}))\right)$$

(This case is handled exactly as the two previous ones since, again, the program point ℓ' where the change of value of variable y is observed is within the loop body so the loop must be entered in part $\ell\pi_2\ell$ of $\ell\pi_2\ell \xrightarrow{\neg(B)}$ after $\llbracket S \rrbracket$ and the loop exit $\ell \xrightarrow{\neg(B)}$ after $\llbracket S \rrbracket$ does not affect the variable y. Similarly for the second trace $\ell\pi'_1$.

— Summing up for case (2), we get $(??) \subseteq \alpha^{4}(\{X\})\ell' \cup (\alpha^{4}(\{X\})\ell \circ (\widehat{\overline{S}}_{diff}[S_b]\ell')]$ nondet(B, B))) which yields (47.63.b) of the form

$$\llbracket \ell' \in \operatorname{in} \llbracket \mathsf{S}_b \rrbracket \ \widehat{\mathscr{E}} \ \big(X(\ell) \ \widehat{\boldsymbol{S}} \ (\widehat{\overline{\boldsymbol{\mathcal{S}}}}^{\sharp}_{\operatorname{diff}} \llbracket \mathsf{S}_b \rrbracket \ \ell') \ \rceil \ \operatorname{nondet}(\mathsf{B},\mathsf{B})) \big) \ \widehat{\boldsymbol{\varepsilon}} \ \emptyset \ \big].$$

where the term $X(\ell')$ does not appear in (47.63.b) by the simplification following from Exercise 15.8.

— (3) Otherwise, the dependency observation point $\ell' = \operatorname{after}[S]$ on prefix traces is after the loop statement $S = \operatorname{while} \ell$ (B) S_h .

(??)

$$= \{ \langle \mathbf{x}, \, \mathbf{y} \rangle \mid \exists \langle \pi_0^\ell, \, \ell \pi_1 \rangle, \langle \pi_0'^\ell, \, \ell \pi_1' \rangle \in \mathcal{F}^* [\![\mathbf{while} \, \ell \, (\mathsf{B}) \, \mathsf{S}_b]\!] \, X \, . \, (\forall \mathsf{z} \in \mathcal{V} \setminus \{\mathsf{x}\} \, . \, \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \wedge \, \mathsf{diff}(\mathsf{seqval} [\![\mathsf{y}]\!] (\mathsf{after} [\![\mathsf{S}]\!]) (\pi_0^\ell, \ell \pi_1), \mathsf{seqval} [\![\mathsf{y}]\!] (\mathsf{after} [\![\mathsf{S}]\!]) (\pi_0'^\ell, \ell \pi_1')) \}$$

 $\ell' = after[S]$

$$= \{\langle \mathsf{x},\,\mathsf{y}\rangle \mid \exists \langle \pi_0^\ell,\, \ell\pi_1\rangle, \langle \pi_0'^\ell,\, \ell\pi_1'\rangle \in \{\langle \pi_0^\ell,\, \ell\pi_2^\ell \xrightarrow{\neg(\mathsf{B})} \mathsf{after}[\![\mathsf{S}]\!]\rangle \mid \langle \pi_0^\ell,\, \ell\pi_2^\ell\rangle \in X \land \mathscr{B}[\![\mathsf{B}]\!] \varrho(\pi_0^\ell\pi_2^\ell) = \mathsf{ff}\} \cup \{\langle \pi_0^\ell,\, \ell\pi_2^\ell \xrightarrow{\mathsf{B}} \mathsf{at}[\![\mathsf{S}_b]\!] \pi_3^{\ell''} \xrightarrow{\mathsf{break}} \mathsf{after}[\![\mathsf{S}]\!]\rangle \mid \langle \pi_0^\ell,\, \ell\pi_2^\ell\rangle \in X \land \mathscr{B}[\![\mathsf{B}]\!] \varrho(\pi_0^\ell\pi_2^\ell) = \mathsf{tt} \land \ell'' \in \mathsf{breaks-of}[\![\mathsf{S}_b]\!] \land \langle \pi_0^\ell\pi_2^\ell \xrightarrow{\mathsf{B}} \mathsf{at}[\![\mathsf{S}_b]\!], \\ \mathsf{at}[\![\mathsf{S}_b]\!] \pi_3^{\ell''} \xrightarrow{\mathsf{break}} \mathsf{after}[\![\mathsf{S}]\!]\rangle \in \mathscr{S}^*[\![\mathsf{S}_b]\!]\} . \ (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} . \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \land \\ \mathsf{diff}(\mathsf{seqval}[\![\mathsf{y}]\!] (\mathsf{after}[\![\mathsf{S}]\!]) (\pi_0^\ell, \ell\pi_1), \mathsf{seqval}[\![\mathsf{y}]\!] (\mathsf{after}[\![\mathsf{S}]\!]) (\pi_0'^\ell, \ell\pi_1')) \}$$

(The only cases in (17.4) where $\ell' = \text{after}[S]$ is reachable is either via (C) for normal termination after zero or more iterations or via (B) through a **break**; in the loop body S_b during the first or later iteration (S)

There are now three subcases, depending on whether the observation prefix traces $\ell \pi_1$ and $\ell \pi'_1$ are both from a normal exit, a both from a break, or one is from a break and the other from a normal exit.

— (3–C–C) This is the case when the observation prefix traces $\ell \pi_1$ and $\ell \pi_1'$ are both from a normal exit.

From there on, the development is very similar to the cases (2.a), (2.b), and (2.c-d) of the condi-

tional with execution traces that may go through the true branch (here entering the loop) or the false branch (here not entering the iteration). There are four subcases (three by symmetry).

- (3-C-C.a) If none of the executions $\pi_0 \ell \pi_2 \ell$ and $\pi'_0 \ell \pi'_2 \ell$ enter the loop body since in both cases the condition B is false, we have $\ell \pi_2 \ell = \ell$ and $\ell \pi'_2 \ell = \ell$.

(??)

(since if $x \notin \text{nondet}(\neg B, \neg B)$ then $x \in \text{det}(\neg B, \neg B)$ so $\mathfrak{B}[\![\neg B]\!]\varrho(\pi_0^\ell)$ and $\mathfrak{B}[\![\neg B]\!]\varrho(\pi_0^\ell)$ would imply $\varrho(\pi_0^\ell)x = \varrho(\pi_0^\ell)x$. Therefore $\varrho(\pi_0^\ell) = \varrho(\pi_0^\ell)$ in contradiction with $\varrho(\pi_0^\ell)y \neq \varrho(\pi_0^\ell)y$.)

- (3-C-C.b) Else, if both executions $\pi_0 \ell \pi_2 \ell$ and $\pi'_0 \ell \pi'_2 \ell$ enter the loop body since in both cases the condition B is true, we have $\ell \pi_2 \ell \neq \ell$ and $\ell \pi'_2 \ell \neq \ell$

(??)

$$= \{\langle \mathsf{x},\,\mathsf{y}\rangle \mid \exists \langle \pi_0^{\,\ell},\, {}^{\ell}\pi_2^{\,\ell}\rangle, \langle \pi_0^{\prime}{}^{\ell},\, {}^{\ell}\pi_2^{\prime}{}^{\ell}\rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!]\varrho(\pi_0^{\,\ell}\pi_2^{\,\ell}) = \mathsf{ff} \land \mathcal{B}[\![\mathsf{B}]\!]\varrho(\pi_0^{\prime}{}^{\ell}\pi_2^{\prime}{}^{\ell}) = \mathsf{ff} \land (\forall \mathsf{z} \in V \setminus \{\mathsf{x}\} \; .\; \varrho(\pi_0^{\,\ell})\mathsf{z} = \varrho(\pi_0^{\prime}{}^{\ell})\mathsf{z}) \land \varrho(\pi_0^{\,\ell}\pi_2^{\,\ell})\mathsf{y} \neq \varrho(\pi_0^{\prime}{}^{\ell}\pi_2^{\prime}{}^{\ell})\mathsf{y}\} \; | \; \mathsf{nondet}(\mathsf{B},\mathsf{B})$$

(case (3–C–C.b) and X belongs to the iterates of $\mathcal{F}^*[[\text{while }\ell] \ (B) \ S_b]]$ so this is possible only when $\mathcal{B}[[B]]\varrho(\pi_0^\ell) = \text{tt}$ and $\mathcal{B}[[B]]\varrho(\pi_0^\ell) = \text{tt}$ and def. (47.48) of nondet

$$\hspace{.5cm} \begin{array}{l} \subseteq \; \{\langle \mathsf{x}, \, \mathsf{y} \rangle \mid \exists \langle \pi_0^{\ell} \ell, \, \ell \pi_2^{\ell} \ell \rangle \in X \; . \; \exists \langle \pi_0'^{\ell} \ell, \, \ell \pi_2'^{\ell} \ell \xrightarrow{\mathsf{B}} \mathsf{at} [\![\mathsf{S}_b]\!] \pi_3^{\ell} \ell \rangle \; . \; \langle \pi_0'^{\ell} \ell, \, \ell \pi_2'^{\ell} \ell \rangle \in X \wedge (\forall \mathsf{z} \in \mathcal{V} \setminus \{\mathsf{x}\} \; . \\ \varrho(\pi_0^{\ell}) \mathsf{z} = \varrho(\pi_0'^{\ell}) \mathsf{z}) \wedge \mathsf{diff}(\mathsf{seqval} [\![\mathsf{y}]\!] \ell(\pi_0^{\ell} \ell, \ell \pi_2^{\ell} \ell), \mathsf{seqval} [\![\mathsf{y}]\!] \ell(\pi_0'^{\ell} \ell, \ell \pi_2'^{\ell} \ell)) \} \end{array}$$

 $\{\operatorname{since} \varrho(\pi_0\ell\pi_2\ell)\mathsf{y} \neq \varrho(\pi_0'\ell\pi_2'\ell)\mathsf{y} \text{ implies diff}(\operatorname{seqval}[\![\mathsf{y}]\!]\ell(\pi_0\ell,\ell\pi_2\ell), \operatorname{seqval}[\![\mathsf{y}]\!]\ell(\pi_0'\ell,\ell\pi_2'\ell))\}$

$$\subseteq \alpha^{\mathfrak{q}}(\{X\})\ell$$
 (def. (47.25) of $\alpha^{\mathfrak{q}}$)

- (3-C-C.c) Otherwise, one execution enters the loop body (say $\pi_0 \ell \pi_2 \ell$) and the other does not (say $\pi'_0 \ell \pi'_2 \ell$), we have (the other case is symmetric) $\ell \pi_2 \ell \neq \ell$ and $\ell \pi'_2 \ell = \ell$. The calculation is similar to (2.c-d) for the simple conditional.

(??)

$$= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0^\ell, \ell \pi_2^\ell \rangle, \langle \pi_0'^\ell, \ell \rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0^\ell) = \mathsf{tt} \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0^\ell \pi_2^\ell) = \mathsf{ff} \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0'^\ell) = \mathsf{ff} \land \langle \mathsf{yz} \in V \setminus \{\mathsf{x}\} \cdot \varrho(\pi_0^\ell) \mathsf{z} = \varrho(\pi_0'^\ell) \mathsf{z}) \land \varrho(\pi_0^\ell \pi_2^\ell) \mathsf{y} \neq \varrho(\pi_0'^\ell) \mathsf{y} \}$$

(case (3–C–C.c) and X is included in the iterates of $\mathscr{F}^*[\text{while }\ell \text{ (B) } S_b]$ so this is possible only when $\mathscr{B}[\![B]\!]\varrho(\pi_0\ell) = \text{tt}$, $\mathscr{B}[\![B]\!]\varrho(\pi_0\ell\pi_2\ell) = \text{ff}$, and $\mathscr{B}[\![B]\!]\varrho(\pi_0\ell) = \text{ff}$)

$$= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0 \ell, \ell \pi_2 \ell \rangle, \langle \pi_0' \ell, \ell \rangle \in X \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0 \ell) = \mathsf{tt} \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0 \ell \pi_2 \ell) = \mathsf{ff} \land \mathcal{B}[\![\mathsf{B}]\!] \varrho(\pi_0' \ell) = \mathsf{ff} \land \langle \mathsf{yz} \in V \setminus \{\mathsf{x}\} : \varrho(\pi_0 \ell) \mathsf{z} = \varrho(\pi_0' \ell) \mathsf{z}) \land \varrho(\pi_0 \ell \pi_2 \ell) \mathsf{y} \neq \varrho(\pi_0' \ell) \mathsf{y} \} \ | \ \mathsf{nondet}(\mathsf{B}, \neg \mathsf{B})$$

(since, by def. (47.48) of nondet, if $x \notin \text{nondet}(B, \neg B)$ then $x \in \text{det}(B, \neg B)$ so by (47.48), $\mathfrak{B}[B]\varrho(\pi_0^\ell)$ and $\mathfrak{B}[\neg B]\varrho(\pi_0^{\ell})$ would imply $\varrho(\pi_0^\ell)x = \varrho(\pi_0^{\ell})x$ and therefore $\varrho(\pi_0^\ell) = \varrho(\pi_0^{\ell})$. X being included in the iterates of $\mathfrak{F}^*[\text{while }\ell \text{ (B) S}_b]$ and, by Exercises 17.13 and 17.21, the language being deterministic, this would imply that $\ell\pi_2^\ell = \ell$, in contradiction with $\mathfrak{B}[B]\varrho(\pi_0^\ell) = \text{tt}$ and $\mathfrak{B}[B]\varrho(\pi_0^\ell\pi_2^\ell) = \text{ff}$

 $= \{\langle \mathsf{x}, \mathsf{y} \rangle \mid \exists \langle \pi_0 ^\ell, \ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3' ^\ell \rangle \; . \; \langle \pi_0 ^\ell, \ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3' ^\ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell) = \mathsf{tt} \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0 ^\ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3' ^\ell) = \mathsf{ff} \land \langle \pi_0 ^\ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket, \; \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3' ^\ell \rangle \in \mathscr{S}^* \llbracket \mathsf{S}_b \rrbracket \land \exists \langle \pi_0' ^\ell, \ell \rangle \in X \land \mathscr{B} \llbracket \mathsf{B} \rrbracket \varrho (\pi_0' ^\ell) = \mathsf{ff} \land (\forall \mathsf{z} \in V \backslash \{\mathsf{x}\} \; . \; \varrho (\pi_0 ^\ell) \mathsf{z} = \varrho (\pi_0' ^\ell) \mathsf{z}) \land \varrho (\pi_0 ^\ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathsf{at} \llbracket \mathsf{S}_b \rrbracket \pi_3' ^\ell) \mathsf{y} \neq \varrho (\pi_0' ^\ell) \mathsf{y} \} \;] \; \mathsf{nondet} (\mathsf{B}, \neg \mathsf{B})$

(by the argument (??) that if $\langle \pi_0 ^\ell, \ \ell \pi_2 ^\ell \rangle \in X$ corresponds to one or more iterations of the loop then it can be written in the form $\ell \pi_2 ^\ell = \ell \pi_2'' ^\ell \stackrel{\mathsf{B}}{\longrightarrow} \mathrm{at} [\![\mathsf{S}_b]\!] \pi_3' ^\ell$ (where $\ell \pi_2'' ^\ell \ell$ may be reduced to ℓ for the first iteration) with $\ell \pi_2'' ^\ell \ell \in X$, $\mathfrak{B}[\![\mathsf{B}]\!] \varrho (\pi_0 ^\ell \pi_2'' ^\ell \ell) = \mathrm{tt}$ and $\langle \pi_0 ^\ell \pi_2'' ^\ell \ell \stackrel{\mathsf{B}}{\longrightarrow} \mathrm{at} [\![\mathsf{S}_b]\!], \mathrm{at} [\![\mathsf{S}_b]\!] \pi_3' ^\ell \ell \rangle \in \mathfrak{S}^* [\![\mathsf{S}_b]\!] \rangle$

(def. (6.6) of ϱ , def. (47.16) of seqval[[y]] and program labelling so that after[[S]] does not appear in the trace (in particular $\ell \neq \text{after}[S]$), and def. (47.18) of diff()

and $\mathfrak{B}[B]\varrho(\pi'\ell) = ff$

?def.∪∫

$$\subseteq \bigcup_{\ell'' \in \mathsf{breaks-of}[\![S_b]\!]} (\{\langle \mathsf{x}, \ \mathsf{x} \rangle \mid \mathsf{x} \in \mathcal{V}\} \cup \{\langle \mathsf{x}, \ \mathsf{y} \rangle \mid \mathsf{x} \in \mathcal{V} \land \mathsf{y} \in \mathsf{mod}[\![S_b]\!]\}) \mid \mathsf{nondet}(\mathsf{B}, \neg \mathsf{B})$$

(since if $y \neq x$ then $\varrho(\pi^\ell)y = \varrho(\pi'^\ell)y = \varrho(\pi'^\ell)y = \varrho(\pi'^\ell)y$ after [S] y so for the value of y to be different in $\varrho(\pi^\ell) \to \operatorname{at}[S_b] = \operatorname$

 $(\mathbb{1}_{V} \cup \{\langle x, y \rangle \mid x \in V \land y \in mod[S_{b}]\}) \mid nondet(B, \neg B)$ (def. identity relation 1 and \cup)

$$= \mathbb{1}_{\mathsf{nondet}(\mathsf{B}, \neg \mathsf{B})} \cup (\mathsf{nondet}(\mathsf{B}, \neg \mathsf{B}) \times \mathsf{mod}[\![\mathsf{S}_b]\!])$$
 (def. \rightarrow)

- Summing up for cases (3-B-B) and (3-B-C), we get

$$(\ref{eq:continuous_and_states}) \in \alpha^{\mbox{\dots}}(\{X\}) \ell_{\mbox{\dots}}^{\mbox{\dots}} \bigg(\bigg(\bigcup_{\ell'' \in \mbox{breaks-of}[\mbox{$\sc S$}_b]\mbox{\dots}} \widehat{\mbox{\dots}}^{\mbox{\dots}}_{\mbox{diff}} [\mbox{$\sc S$}_b] \ell'' \bigg) \ended{(B, B)} \cup \mathbbm{1}_{\mbox{nondet}(B, \neg B)} \cup (\mbox{nondet}(B, \neg B) \times \mbox{mod}[\mbox{$\sc S$}_b]\mbox{\dots}).$$

— Summing up for all subcases of (3) for a dependency observation point $\ell' = \text{after}[S]$, we would get a term (47.63.c) of the form

that can be simplified as follows (while loosing precision)

(??)

$$\subseteq \mathbb{1}_{\operatorname{nondet}(\neg \mathsf{B}, \neg \mathsf{B})} \cup \alpha^{\triangleleft}(\{X\})^{\ell} \cup (\alpha^{\triangleleft}(\{X\})^{\ell})^{\beta} \otimes (\mathbb{1}_{\operatorname{nondet}(\neg \mathsf{B}, \neg \mathsf{B})} \cup \operatorname{nondet}(\neg \mathsf{B}, \neg \mathsf{B}) \times \operatorname{mod}[\![\mathbf{S}_b]\!])) \mid \\ \operatorname{nondet}(\mathsf{B}, \neg \mathsf{B}) \cup \alpha^{\triangleleft}(\{X\})^{\ell} \otimes \left(\left(\bigcup_{\ell'' \in \operatorname{breaks-of}[\![\mathbf{S}_b]\!]} \widehat{\widehat{\mathcal{S}}}^{\exists}_{\operatorname{diff}}[\![\mathbf{S}_b]\!] \ell'' \right) \mid \operatorname{nondet}(\mathsf{B}, \mathsf{B}) \right) \cup \mathbb{1}_{\operatorname{nondet}(\mathsf{B}, \neg \mathsf{B})} \cup \\ \operatorname{(nondet}(\mathsf{B}, \neg \mathsf{B}) \times \operatorname{mod}[\![\mathbf{S}_b]\!])$$

$$\subseteq \mathbb{1}_{\mathscr{V}} \cup \alpha^{\operatorname{d}}(\{X\})^{\varrho} \cup (\alpha^{\operatorname{d}}(\{X\})^{\varrho} \circ (\mathbb{1}_{\mathscr{V}} \cup \mathscr{V} \times \operatorname{mod}[\![\mathbf{S}_b]\!])) \cup \alpha^{\operatorname{d}}(\{X\})^{\varrho} \circ \left(\left(\bigcup_{\ell'' \in \operatorname{breaks-of}[\![\mathbf{S}_b]\!]} \widehat{\overline{\mathcal{S}}}_{\operatorname{diff}}^{\exists} [\![\mathbf{S}_b]\!] \ell'' \right) \right)$$

$$\operatorname{nondet}(\mathsf{B},\mathsf{B}) \right) \cup \mathbb{1}_{\mathscr{V}} \cup (\mathscr{V} \times \operatorname{mod}[\![\mathbf{S}_b]\!])$$

(since nondet(B₁, B₂) $\subseteq V$ so $\mathbb{1}_{\text{nondet}(B_1,B_2)} \subseteq \mathbb{1}_V$ and def.]

$$\subseteq \mathbb{1}_{\mathscr{V}} \ \cup \ \alpha^{\mathrm{d}}(\{X\})^{\ell} \ \cup \ (\alpha^{\mathrm{d}}(\{X\}) \ ^{\ell} \ ^{\circ}_{\circ} \ \mathbb{1}_{\mathscr{V}}) \ \cup \ (\alpha^{\mathrm{d}}(\{X\}) \ ^{\ell} \ ^{\circ}_{\circ} \ \mathscr{V} \ \times \ \mathrm{mod}[\![\mathtt{S}_{b}]\!])) \ \cup \ \alpha^{\mathrm{d}}(\{X\})^{\ell} \ ^{\circ}_{\circ} \ \left(\left(\bigcup_{\mathfrak{C}'' \in \mathrm{breaks-of}[\![\mathtt{S}_{b}]\!]} \widehat{\overline{\mathcal{S}}}^{\exists}_{\mathrm{diff}}[\![\mathtt{S}_{b}]\!] \ ^{\ell''} \right) \ \mathsf{l} \ \mathrm{nondet}(\mathtt{B},\mathtt{B}) \right) \cup \ \mathbb{1}_{\mathscr{V}} \cup \ (\mathscr{V} \times \mathrm{mod}[\![\mathtt{S}_{b}]\!])$$

? since ; distributes over ∪ \

$$= \ \mathbb{1}_{\mathbb{V}} \cup \alpha^{\mathbb{q}}(\{X\}) \ell \cup \left((\mathbb{1}_{\mathbb{V}} \cup \alpha^{\mathbb{q}}(\{X\}) \ell) \circ (\mathbb{V} \times \mathsf{mod}[\![\mathbf{S}_b]\!])\right) \cup \alpha^{\mathbb{q}}(\{X\}) \ell \circ \left(\left(\bigcup_{\ell'' \in \mathsf{breaks-of}[\![\mathbf{S}_b]\!]} \widehat{\overline{\mathcal{S}}}^{\mathbb{q}}_{\mathsf{diff}}[\![\mathbf{S}_b]\!] \ell''\right) \rceil$$

nondet(B, B) (idempotency law for
$$\cup$$
 and \S distributes over \cup)

After simplification, we get a term (47.63.c) of the form

$$\begin{split} \llbracket \, \ell' &= \mathsf{after} \llbracket \mathsf{S} \rrbracket \, \, \widehat{\mathbb{S}} \, \, \, \rrbracket_{\mathcal{V}} \cup X(\ell) \cup \left(\left(\mathbb{1}_{\mathcal{V}} \cup X(\ell) \right) \, \mathring{\varsigma} \, \left(\mathcal{V} \times \mathsf{mod} \llbracket \mathsf{S}_b \rrbracket \right) \right) \cup \\ & X(\ell) \, \mathring{\varsigma} \, \left(\left(\bigcup_{\ell'' \in \mathsf{breaks-of}} \widehat{\overline{\mathbb{S}}_b} \right] \, \ell'' \right) \, \rceil \, \, \mathsf{nondet}(\mathsf{B}, \mathsf{B}) \right) \, \mathring{\varsigma} \, \, \, \mathscr{O} \, \, \mathring{\rbrace}. \end{aligned}$$

For fixpoints X of $\mathcal{F}^{\text{diff}}[\text{while }\ell$ (B) $S_b]$, we have $\mathbb{1}_V \subseteq X(\ell)$ by (47.63.a) so that, by the chaotic iteration theorem [DBLP:journals/sigart/CousotC77, Cousot-IMAG-RR88-1977], $\mathbb{1}_V \cup X(\ell)$ can be replaced by $X(\ell)$. We get a term (47.63.c) of the form

$$\begin{split} \big\|\,\ell' &= \mathsf{after}\big[\![\mathsf{S} \big]\!] \,\, \widehat{\mathscr{E}} \,\, X(\ell) \cup \big(X(\ell\, \begin{subarray}{c} \circ \ (\mathcal{V} \times \mathsf{mod}\big[\![\mathsf{S}_b \big]\!] \big) \big) \, \cup \\ & X(\ell)\, \begin{subarray}{c} \circ \ \left(\Big(\bigcup_{\ell'' \in \mathsf{breaks-of}\big[\![\mathsf{S}_b \big]\!]} \,\, \widehat{\overline{\mathcal{S}}}^{\exists}_{\mathsf{diff}}\big[\![\mathsf{S}_b \big]\!] \,\, \ell'' \, \right) \, \big] \,\, \mathsf{nondet}(\mathsf{B},\mathsf{B}) \, \big) \, \circ \,\, \emptyset \, \big]. \end{split}$$

— Summing up for all cases (1), (2), and (3) for all dependency observation points, we conclude that

$$\forall \ell' \in \mathsf{labx}[\![\mathtt{S}]\!] \ . \ \alpha^{\mathsf{d}}(\{\boldsymbol{\mathcal{F}}^*[\![\mathtt{while}\ \ell\ (\mathtt{B})\ \mathtt{S}_b]\!](X)\})\ \ell' \subseteq \boldsymbol{\mathcal{F}}^{\mathsf{diff}}[\![\mathtt{while}\ \ell\ (\mathtt{B})\ \mathtt{S}_b]\!]\ \alpha^{\mathsf{d}}(\{X\})\ \ell' \subseteq \boldsymbol{\mathcal{F}}^{\mathsf{diff}}[\![\mathtt{while}\ \ell\ (\mathtt{B})\ \mathtt{S}_b]\!]$$

proving pointwise semi-commutation.

5 Mathematical proofs of chapter 48

Proof of Lemma 48.63 By induction on the sequence of calls to unify. We proceed by by calculational design and case analysis on the structure of τ_1 and τ_2 which can be a variable or a structured term and may belong to the domain of θ_0 , or not.

• If unify $(\tau_1, \tau_2, \vartheta_0) = \Omega_s^r$ in case (48.47.8) of an occur-check, we have $\gamma_s^r(\Omega_s^r) = \emptyset$ by (48.46). By the test (48.47.8), $\alpha \in \text{Vars}[\![\tau_2]\!]$. If $\tau_2 = \beta \in V_t$ were a variable then the test $\alpha \in \text{Vars}[\![\tau_2]\!]$ at (48.47.8) would be true only if $\alpha = \beta$ but this case is prevented by the test (48.47.7). By contradiction, $\tau_2 \notin V_t$ in case (48.47.8). It follows, by def. (48.51) of γ_e that $\gamma_e(\tau_1 \doteq \tau_2) = \gamma_e(\alpha \doteq \tau_2) = \emptyset$ since otherwise, there would be some $\boldsymbol{\varrho}$ such that $\boldsymbol{\varrho}(\tau_1) = \boldsymbol{\varrho}(f(\dots \alpha \dots))$ which would be an infinite object not in \mathbf{P}^{ν} , as shown in Lemma 48.9.

- By Lemma 48.58, unify does terminate so that, in case (48.47.6) with $\theta_n = \Omega_s^r$ there must be a series of recursive calls ending up in (48.47.8). So τ_1 or τ_2 has a recursive subterm which, again by Lemma 48.9, implies $\gamma_s^r(\text{unify}(\tau_1, \tau_2, \theta_0)) = \gamma_s^r(\text{unify}(\tau_1, \tau_2, \theta_0)) = \gamma_s^r(\Omega_s^r) = \emptyset$;
- In case (48.47.6) with $\vartheta_n \neq \Omega_s^r$, we have,

$$\begin{split} & \gamma_{\mathbf{e}}(\boldsymbol{\tau}_{1} \doteq \boldsymbol{\tau}_{2}) \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = \gamma_{\mathbf{e}}(f(\boldsymbol{\tau}_{1}^{1}, \dots, \boldsymbol{\tau}_{1}^{n}) \doteq g(\boldsymbol{\tau}_{2}^{1}, \dots, \boldsymbol{\tau}_{2}^{m})) \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = \gamma_{\mathbf{e}}(f(\boldsymbol{\tau}_{1}^{1}, \dots, \boldsymbol{\tau}_{1}^{n}) \doteq g(\boldsymbol{\tau}_{2}^{1}, \dots, \boldsymbol{\tau}_{2}^{m})) \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(f(\boldsymbol{\tau}_{1}^{1}, \dots, \boldsymbol{\tau}_{1}^{n})) = \boldsymbol{\varrho}(f(\boldsymbol{\tau}_{2}^{1}, \dots, \boldsymbol{\tau}_{2}^{m}))\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(f(\boldsymbol{\tau}_{1}^{1}, \dots, \boldsymbol{\tau}_{1}^{n})) = \boldsymbol{\varrho}(f(\boldsymbol{\tau}_{2}^{1}, \dots, \boldsymbol{\tau}_{2}^{m}))\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\rho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \\ & = \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0}) \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0})) \cap \bigcap_{l=1}^{n} \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0})) \cap \bigcap_{l=1}^{n} \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0})) \cap \bigcap_{l=1}^{n} \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{0})) \cap \bigcap_{l=1}^{n} \{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}) = \boldsymbol{\varrho}(\boldsymbol{\tau}_{2}^{1})\} \cap \gamma_{\mathbf{s}}^{\mathbf{f}}(\vartheta_{1})) \quad \text{$(\text{ind. hyp. and } \cap \text{commutative})$} \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho} \in \mathsf{P}^{\boldsymbol{\nu}} \mid \boldsymbol{\varrho}(\boldsymbol{\tau}_{1}^{1}, \boldsymbol{\tau}_{2}^{1}, \vartheta_{0}) \text{ in} \\ & \dots \\ & = (\{\boldsymbol{\varrho}$$

 (def. (48.52) of γ_{s}^{r})

$$= \gamma_{s}^{r} (\text{unify}(\boldsymbol{\tau}_{1}, \boldsymbol{\tau}_{2}, \vartheta_{0}))$$
 (48.47.11))

• In case (48.47.12), we have $\tau_1 = \alpha \in \text{dom}(\theta_0)$ by tests (48.47.9) and (48.47.10) and $\tau_2 \notin V_{\tilde{x}}$ since test (48.47.1) is ff.

$$\begin{split} \gamma_{\mathbf{e}}(\pmb{\tau}_1 &\doteq \pmb{\tau}_2) \cap \gamma_{\mathbf{s}}^{\mathbf{r}}(\vartheta_0) \\ &= \gamma_{\mathbf{e}}(\alpha \doteq \pmb{\tau}_2) \cap \gamma_{\mathbf{s}}^{\mathbf{r}}(\vartheta_0) \\ &= \{ \pmb{\varrho} \in \pmb{\mathsf{P}}^{\nu} \mid \pmb{\varrho}(\alpha) = \pmb{\varrho}(\pmb{\tau}_2) \land \forall \beta \in V_{\hat{t}} : \pmb{\varrho}(\beta) = \pmb{\varrho}(\vartheta_0(\beta)) \} \\ &= \{ \pmb{\varrho} \in \pmb{\mathsf{P}}^{\nu} \mid \pmb{\varrho}(\vartheta_0(\alpha)) = \pmb{\varrho}(\pmb{\tau}_2) \land \forall \beta \in V_{\hat{t}} : \pmb{\varrho}(\beta) = \pmb{\varrho}(\vartheta_0(\beta)) \} \\ &= \{ \pmb{\varrho} \in \pmb{\mathsf{P}}^{\nu} \mid \pmb{\varrho}(\vartheta_0(\alpha)) = \pmb{\varrho}(\pmb{\tau}_2) \land \forall \beta \in V_{\hat{t}} : \pmb{\varrho}(\beta) = \pmb{\varrho}(\vartheta_0(\beta)) \} \\ &= \gamma_{\mathbf{e}}(\vartheta_0(\alpha) \doteq \pmb{\tau}_2) \cap \gamma_{\mathbf{s}}^{\mathbf{r}}(\vartheta_0) \\ &= \gamma_{\mathbf{s}}^{\mathbf{r}}(\mathsf{unify}(\vartheta_0(\alpha), \pmb{\tau}_2, \vartheta_0)) \\ &= \gamma_{\mathbf{s}}^{\mathbf{r}}(\mathsf{unify}(\vartheta_0(\alpha), \pmb{\tau}_2, \vartheta_0)) \\ &= \gamma_{\mathbf{s}}^{\mathbf{r}}(\mathsf{unify}(\pmb{\tau}_1, \pmb{\tau}_2, \vartheta_0)) \\ &= \gamma_{\mathbf{s}}^{\mathbf{r}}(\mathsf{unify}(\pmb{\tau}$$

 In case (48.47.13) we are back to (48.47.11) or (48.47.12) by the symmetry argument of Remark 48.49.

The following Lemma ?? shows that new entries are successively added to the table T_0 .

Lemma 11 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0 \in \mathbf{T}^{\nu}$, if $\mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0)$ is (recursively) called from the main call $\mathsf{lcg}(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0)$ and returns $\langle \boldsymbol{\tau}, T' \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0)$, then

$$\begin{array}{ll} \text{preinvariant:} & \pmb{\tau}_1, \pmb{\tau}_2 \in \pmb{\mathsf{T}}^{\scriptscriptstyle V} \wedge T_0 \in V_{\bar{t}} \nrightarrow \pmb{\mathsf{T}}^{\scriptscriptstyle V} \times \pmb{\mathsf{T}}^{\scriptscriptstyle V} \\ \text{postinvariant:} & \pmb{\tau} \in \pmb{\mathsf{T}}^{\scriptscriptstyle V} \wedge T' \in V_{\bar{t}} \nrightarrow \pmb{\mathsf{T}}^{\scriptscriptstyle V} \times \pmb{\mathsf{T}}^{\scriptscriptstyle V} \wedge \text{vars}[\![\pmb{\tau}]\!] \subseteq \text{dom}(T') \wedge \end{array}$$

$$\forall \alpha \in \mathsf{dom}(T_0) : T_0(\alpha) = T'(\alpha)$$

Proof of Lemma ?? By induction on the sequence of calls to lub and, for any given call, by recurrence to handle the recursive calls at (48.68.2), ..., (48.68.4), and by case analysis on the conditional.

The first call at (48.68.12) satisfies the preinvariant of (48.39) since $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0 \in \mathbf{T}^{\nu}$ by hypothesis and $T_0 = \varnothing \in V_{\bar{\tau}} \to \mathbf{T}^{\nu} \times \mathbf{T}^{\nu}$;

Assuming that an intermediate call to $lub(\tau_1, \tau_2, T_0)$ satisfies the preinvariant (48.39), the proof that it satisfies the postinvariant (48.39) is by case analysis.

- In case (48.68.5), $\tau_j \in \mathsf{T}^{\nu}$ by hypothesis on the intermediate call, so $\tau_j^i \in \mathsf{T}^{\nu}$, $i = 1, \dots, n$, j = 1, 2, by the test (48.68.1). Then we proceed by recurrence on the recursive calls.
 - For the basis i = 0, T_0 satisfies (48.39) by hypothesis on the intermediate call;
 - Assume, by recurrence hypothesis for $i \in [0, n[$, that $T_i \in V_t \to \mathbf{T}^{\nu} \times \mathbf{T}^{\nu} \wedge \forall \alpha \in \text{dom}(T_0)$. $T_0(\alpha) = T_i(\alpha)$. Then, by induction on the sequence of calls to lub, $\mathbf{\tau}^{i+1} \in \mathbf{T}^{\nu}$ and $T_{i+1} \in V_t \to \mathbf{T}^{\nu} \times \mathbf{T}^{\nu} \wedge \text{vars}[\![\mathbf{\tau}^{i+1}]\!] \subseteq \text{dom}(T_{i+1}) \wedge \forall \alpha \in \text{dom}(T_i)$. $T_i(\alpha) = T_{i+1}(\alpha)$. By transitivity, $\forall \alpha \in \text{dom}(T_0)$. $T_0(\alpha) = T_{i+1}(\alpha)$.

By recurrence for $i = n, T' = T_n$ at (48.68.5) satisfies (48.39) since $\boldsymbol{\tau}^i \in \boldsymbol{\mathsf{T}}^v$, $i = 1, \dots, n$, implies $f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n) \in \boldsymbol{\mathsf{T}}^v$ and $\text{vars}[f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)] = \bigcup_{i=1}^n \text{vars}[\boldsymbol{\tau}^i]$;

- The case (48.68.7) is trivial since $\beta \in \mathbf{T}^{\nu}$, $T' = T_0$, and $\beta \in \text{dom}(T_0)$;
- In case (48.68.9), $T_0 \in V_{\bar{t}} \to \mathbf{T}^{\nu} \times \mathbf{T}^{\nu}$ by hypothesis, $\beta \in \mathbf{T}^{\nu}$, and $\beta \in V_{\bar{t}} \setminus \text{dom}(T_0)$ by the test (48.68.8) so $T' = \langle \mathbf{\tau}_1, \mathbf{\tau}_2 \rangle [\beta \leftarrow T_0] \in V_{\bar{t}} \to \mathbf{T}^{\nu} \times \mathbf{T}^{\nu}$ and for all $\alpha \in \text{dom}(T_0)$, $\alpha \neq \beta$ so $T'(\alpha) = \langle \mathbf{\tau}_1, \mathbf{\tau}_2 \rangle [\beta \leftarrow T_0](\alpha) = T_0(\alpha)$. Moreover $\beta \in \text{Vars}[\langle \mathbf{\tau}_1, \mathbf{\tau}_2 \rangle [\beta \leftarrow T_0]] = \text{Vars}[T']$. \square

Remark Lemma ?? shows that T_0 can be declared as a variable local to lcg and global to lub, which would be unitialized to \emptyset and updated by an assignment at (48.68.9).

For $T \in V_{t} \to \mathbf{T}^{v} \times \mathbf{T}^{v}$, let us define, when $\alpha \in \text{dom}(T)$,

$$\overline{\zeta}_1(T)\alpha \triangleq \det \langle \boldsymbol{\tau}_1, \, \boldsymbol{\tau}_2 \rangle = T(\alpha) \text{ in } \boldsymbol{\tau}_1$$

$$\overline{\zeta}_2(T)\alpha \triangleq \det \langle \boldsymbol{\tau}_1, \, \boldsymbol{\tau}_2 \rangle = T(\alpha) \text{ in } \boldsymbol{\tau}_2$$

$$(13)$$

(which is undefined when $\alpha \notin \text{dom}(T)$ in which case (48.30) applies, in particular when $T = \emptyset$). The following Lemma **??** shows that table T_0 maintains two substitutions $\bar{\varsigma}_1(T)$ and $\bar{\varsigma}_1(T)$ which can be used to instantiate the term resulting from the call to the parameters.

Lemma 14 For all $\boldsymbol{\tau}_1^0$, $\boldsymbol{\tau}_2^0$, $\boldsymbol{\tau}_1$, $\boldsymbol{\tau}_2 \in \boldsymbol{\mathsf{T}}^{\nu}$ and $T_0 \in \wp(V_t \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu})$, if $\mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0)$ is (recursively) called from the main call $\mathsf{lcg}(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0)$ and returns $\langle \boldsymbol{\tau}, T' \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0)$, then

$$\bar{\zeta}_1(T')\boldsymbol{\tau} = \boldsymbol{\tau}_1 \quad \text{and} \quad \bar{\zeta}_2(T')\boldsymbol{\tau} = \boldsymbol{\tau}_2$$
 (??)

Proof of Lemma ?? The preinvariant is tt. By induction on the sequence of calls to lub and, for any given call, by recurrence to handle the recursive calls at (48.68.2), ..., (48.68.4), and by case analysis for the conditional.

- In case (48.68.5), by recurrence and induction on the sequence of recursive calls to leq, we have $\overline{\zeta}_1(T_i)\boldsymbol{\tau}^i = \boldsymbol{\tau}_1^i$ and $\overline{\zeta}_2(T_i)\boldsymbol{\tau}^i = \boldsymbol{\tau}_2^i$ for all $i \in [1,n]$. By the postinvariant of (48.39), we have $\forall \alpha \in \text{dom}(T_i)$. $T_0(\alpha) = T_{i+1}(\alpha)$. It follows, by (??) that $\forall \alpha \in \text{vars}[\boldsymbol{\tau}^i] \subseteq \text{dom}(T_i)$. $T_i(\alpha) = T_{i+1}(\alpha)$. Therefore, by (??), $\forall \alpha \in \text{vars}[\boldsymbol{\tau}^i]$. $\theta_j(T_{i+1})(\boldsymbol{\tau}^i) = \theta_j(T_i)(\boldsymbol{\tau}^i)$. It follows by (48.30) that $\theta_j(T_n)(f(\boldsymbol{\tau}^1,\boldsymbol{\tau}^2,\ldots,\boldsymbol{\tau}^n)) = f(\theta_j(T_n)(\boldsymbol{\tau}^1),\theta_j(T_n)(\boldsymbol{\tau}^2),\ldots,\theta_j(T_n)(\boldsymbol{\tau}^n)) = f(\theta_j(T_1)(\boldsymbol{\tau}^1),\theta_j(T_2)(\boldsymbol{\tau}^2),\ldots,\theta_j(T_n)(\boldsymbol{\tau}^n)) = f(\boldsymbol{\tau}_1^i,\ldots,\boldsymbol{\tau}_n^i) = \boldsymbol{\tau}_i, j = 1,2;$
- In case (48.68.7), (??) directly follows from $\tau = \beta$, $T' = T_0$, $\beta \in \text{dom}(T_0)$, $T_0(\beta) = \langle \tau_1, \tau_2 \rangle$, and (??);
- In case (48.68.9), $\bar{\zeta}_j(T')\boldsymbol{\tau} = \vartheta_j(\langle \boldsymbol{\tau}_1, \, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0])\beta = \text{if } \beta \in \text{dom}(T) \text{ then let } \langle \boldsymbol{\tau}_1', \, \boldsymbol{\tau}_2' \rangle = \langle \boldsymbol{\tau}_1, \, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0](\beta) \text{ in } \boldsymbol{\tau}_j' \text{ else } \alpha = \boldsymbol{\tau}_j, \, j = 1, 2.$

 $lgc(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)$ computes an upper-bound of $\boldsymbol{\tau}_1$ and $\boldsymbol{\tau}_2$.

Lemma 16 For all
$$\boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \in \boldsymbol{\mathsf{T}}^{\nu}$$
, the lgc algorithm terminates with $[\boldsymbol{\tau}_1]_{=^{\nu}} \leq_{=^{\nu}} [\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}}$ and $[\boldsymbol{\tau}_2]_{=^{\nu}} \leq_{=^{\nu}} [\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}}$.

Proof of Lemma ?? The termination proof of lub(τ_1 , τ_2 , T_0) is by structural induction on τ_1 (or τ_2). So the main call lub(τ_1 , τ_2 , \varnothing) at (48.68.12) does terminate.

Lemma ?? follows by def. of the infimum $\overline{\varnothing}^{\nu}$ in cases (48.68.11).

Otherwise, at (48.68.12), $\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2) = \boldsymbol{\tau}$ where $\langle \boldsymbol{\tau}, T \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \varnothing)$. By (48.42), $\overline{\varsigma}_j(T)\boldsymbol{\tau} = \boldsymbol{\tau}_j, j = 1, 2$. So by Exercise 48.16, $[\boldsymbol{\tau}_j]_{=^{\nu}} \leq_{=^{\nu}} [\boldsymbol{\tau}]_{=^{\nu}} = [\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}}$.

Let $[\boldsymbol{\tau}']_{=^{\nu}}$ be an upper bound of $[\boldsymbol{\tau}_1]_{=^{\nu}}$ and $[\boldsymbol{\tau}_2]_{=^{\nu}}$ i.e. $\boldsymbol{\tau}_1 \leq_{=^{\nu}} \boldsymbol{\tau}'$ and $\boldsymbol{\tau}_2 \leq_{=^{\nu}} \boldsymbol{\tau}'$ so that, by Theorem 48.31, there exists substitutions ϑ_1 and ϑ_2 such that $\vartheta_1(\boldsymbol{\tau}') = \boldsymbol{\tau}_1$ and $\vartheta_2(\boldsymbol{\tau}') = \boldsymbol{\tau}_2$. We must prove that $[\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}} \leq_{=^{\nu}} [\boldsymbol{\tau}']_{=^{\nu}}$ that is, by Theorem 48.31, that there exist a substitution ϑ' such that $\vartheta'(\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)) = \boldsymbol{\tau}'$.

We modify the lub algorithm into lub' (which calls lub) as given in Figure $\ref{eq:theta}$ to construct this substitution ϑ' given any upper bound $\ref{eq:theta}$.

Example 19 The assumption (??.??) prevents a call like lub' $(f(a,b), f(b,a), \emptyset, f(\alpha,\alpha), \varepsilon, \emptyset)$ where $f(\alpha,\alpha)$ is not an upper bound of $\{f(a,b), f(b,a)\}$.

```
Example 20 For \tau_1 = f(g(a), g(g(a)), g(a), b, b), \tau_2 = f(g(b), g(h(b)), g(b), a, a) and \tau' = f(g(a), g(h(b)), g(h(b)), g(h(b)), g(h(b)), g(h(b))
f(q(\alpha), \beta, q(\alpha), \gamma, U), we have
lub'(f(q(a), q(q(a)), q(a), b, b), f(q(b), q(h(b)), q(b), a, a), \emptyset, f(q(\alpha), \beta, q(\alpha), \gamma, U), \varepsilon)
           lub'(q(a), q(b), \emptyset, q(\alpha), \varepsilon)
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
                       lub'(a, b, \emptyset, \alpha, \varepsilon)
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
                        = \langle \beta, \{ \langle \beta, \langle a, b \rangle \rangle \}, \{ \langle \alpha, \beta \rangle \} \rangle
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
            = \langle g(\beta), \{\langle \beta, \langle a, b \rangle \rangle\}, \{\langle \alpha, \beta \rangle\} \rangle
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
           lub'(g(g(a)), g(h(b)), \{\langle \beta, \langle a, b \rangle \rangle\}, \beta, \{\langle \alpha, \beta \rangle\})
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
                        lub(g(a), h(b), \{\langle \beta, \langle a, b \rangle \rangle\})
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
                        = \langle \gamma, \{ \langle \beta, \langle a, b \rangle \rangle, \langle \gamma, \langle g(a), h(b) \rangle \} \rangle
            = \langle g(\gamma), \{ \langle \beta, \langle a, b \rangle \rangle, \langle \gamma, \langle g(a), h(b) \rangle \}, \{ \langle \alpha, \beta \rangle, \langle \beta, g(\gamma) \rangle \} \rangle
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
            \mathsf{lub}'(g(a), g(b), \{\langle \beta, \langle a, b \rangle \rangle, \langle \gamma, \langle g(a), h(b) \rangle \}, g(\alpha), \{\langle \alpha, \beta \rangle, \langle \beta, g(\gamma) \rangle \})
                                                                                                                                                                                                                                                                                                                                                                                                                                            (??.??)
                       lub'(a, b, \{\langle \beta, \langle a, b \rangle \rangle, \langle \gamma, \langle g(a), h(b) \rangle \}, \alpha, \{\langle \alpha, \beta \rangle, \langle \beta, g(\gamma) \rangle \})

```

We must show that lub' and lub compute the same result τ .

```
Lemma 21 For all \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}, \boldsymbol{\tau}', \boldsymbol{\tau}'' \in \boldsymbol{\mathsf{T}}^{\nu}, T_0, T, T'' \in \wp(V_{\ell} \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu}), and \vartheta_0, \vartheta' \in V_{\ell} \nrightarrow \boldsymbol{\mathsf{T}}^{\nu}, if \langle \boldsymbol{\tau}, T, \vartheta' \rangle = \mathsf{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \vartheta_0) and \langle \boldsymbol{\tau}'', T'' \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0) then \boldsymbol{\tau} = \boldsymbol{\tau}'' and T = T''. \square
```

Proof of Lemma ?? Any execution trace of lub'(τ_1 , τ_2 , T_0 , τ' , ϑ_0) can be abstracted into an execution trace of lub(τ_1 , τ_2 , T_0) simply by ignoring the input ϑ_0 , the resulting substitution ϑ' , ignoring the program point (??.??) and mapping (??.??), ..., (??.??) and (??.??), ..., (??.??) to the program point (48.68.2), ..., (48.68.5). The proof is by induction on the calls to lub and lub' which are synchronous in the two traces. The point is that the result $\langle \tau, T \rangle$ of a call $\langle \tau, T, \vartheta' \rangle = \text{lub'}(\tau_1, \tau_2, T_0, \tau', \vartheta_0)$ does not depend during its computation on the parameters τ' , and ϑ_0 . An exception is the test (??.??) but the two alternative yield the same result. (??.??), ..., (??.??) is identical to (48.68.2), ..., (48.68.4) while, by induction on the sequence of calls to lub' (??.??), ..., (??.??) is abstracted to that of (48.68.2), ..., (48.68.4). It follows that $\langle \tau, T \rangle$ at (48.68.12) is equal to $\langle \tau, T \rangle$ at (??.??).

The following Lemma ?? proves the well-typing of algorithm lub'.

```
Lemma 22 For all \boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}' \in \boldsymbol{\mathsf{T}}^{\nu}, T_0 \in \wp(V_{\bar{t}} \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu}), and \boldsymbol{\vartheta}_0, \boldsymbol{\vartheta}_1, \boldsymbol{\vartheta}_2 \in V_{\bar{t}} \to \boldsymbol{\mathsf{T}}^{\nu}, if \mathsf{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \boldsymbol{\vartheta}_0) is (recursively) called from the main call \mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\varnothing}, \boldsymbol{\tau}_0', \boldsymbol{\varepsilon}) with hypothesis \boldsymbol{\vartheta}_1(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \boldsymbol{\vartheta}_2(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0, then the case analysis in the definition of \mathsf{lub}' is complete (i.e., there is no missing case) and \exists \gamma \in V_{\bar{t}} : \boldsymbol{\tau}' = \gamma at (??.??) and (??.??).
```

Proof of Lemma ?? Notice that Lemmata **??**, **??**, and **??** are valid for lub' since they do not involve the extra parameters τ' , θ_0 or result θ' . The proof is by case analysis.

- For (??.??), the only possible cases for τ' are (??.??) and (??.??), by definition (48.2) of terms with variables.
- For (??.??) and (??.??), the test (??.??) is false so, by the preinvariant of Lemma ?? and def. (48.2) of terms with variables, at least one τ_j , j=1,2 of τ_1 or τ_2 is a variable. Then τ' must be a variable since otherwise $\tau'=g(\tau'_1,\ldots,\tau'_m)$ so that it is impossible that $\theta_j(\tau')=\tau_j$ be a variable.

The following Lemma $\ref{lem:sphere}$ shows that variables recorded in T_0 are for non-matching subterms only.

Lemma 23 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \in \boldsymbol{\mathsf{T}}^{v}$ and $T_0 \in \wp(V_{\hat{\boldsymbol{t}}} \times \boldsymbol{\mathsf{T}}^{v} \times \boldsymbol{\mathsf{T}}^{v})$, if lub $(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0)$ is (recursively) called from the main call lub $(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing)$, then for all $\boldsymbol{\tau}_1', \boldsymbol{\tau}_1'^1, \ldots, \boldsymbol{\tau}_1'^n, \boldsymbol{\tau}_2', \boldsymbol{\tau}_2'^1, \ldots, \boldsymbol{\tau}_2'^n \in \boldsymbol{\mathsf{T}}^{v}$, if $\exists f \in \boldsymbol{\mathsf{F}}_n : \boldsymbol{\tau}_1' = f(\boldsymbol{\tau}_1'^1, \ldots, \boldsymbol{\tau}_1'^n) \land \boldsymbol{\tau}_2' = f(\boldsymbol{\tau}_2'^1, \ldots, \boldsymbol{\tau}_2'^n)$ then $\forall \beta \in \mathsf{dom}(T_0)$.

$$T_0(\beta) \neq \langle \boldsymbol{\tau}_2', \ \boldsymbol{\tau}_1' \rangle.$$

Proof of Lemma ?? Let us prove the contraposition, that is "if $\exists \beta \in \text{dom}(T_0)$. $T_0(\beta) = \langle \pmb{\tau}_2', \pmb{\tau}_1' \rangle$ then $\forall f \in \pmb{\mathsf{F}}_n$. $\pmb{\tau}_1' \neq f(\pmb{\tau}_1'^1, \dots, \pmb{\tau}_1'^n) \vee \pmb{\tau}_2' \neq f(\pmb{\tau}_2'^1, \dots, \pmb{\tau}_2'^n)$ ". The proof is by induction on the sequence of calls to lub and Lemma **??** is obviously true for

The proof is by induction on the sequence of calls to lub and Lemma ?? is obviously true for the initial value of $T_0 = \emptyset$. Then observe that the only modification to the parameter T_0 in calls to lub is (48.68.9) for which (48.68.1) is false so that the returned T' is $\langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0]$ with $\neg(\boldsymbol{\tau}_1 = f(\boldsymbol{\tau}_1^1, \dots, \boldsymbol{\tau}_1^n) \wedge \boldsymbol{\tau}_2 = f(\boldsymbol{\tau}_2^1, \dots, \boldsymbol{\tau}_2^n))$. This property is preserved by the recursive calls (??.??) to (??.??) for T_n returned at (??.??) as well as for the unmodified T_0 returned at (??.??). By induction, Lemma ?? holds for all calls from the main call (??.??).

Lemma 24 For all $\boldsymbol{\tau}_{1}^{0}$, $\boldsymbol{\tau}_{2}^{0}$, $\boldsymbol{\tau}_{1}$, $\boldsymbol{\tau}_{2}$, $\boldsymbol{\tau}_{0}'$, $\boldsymbol{\tau}_{1}'$ \in $\boldsymbol{\mathsf{T}}^{v}$, T_{0} , $T \in V_{\varepsilon} \nrightarrow (\boldsymbol{\mathsf{T}}^{v} \times \boldsymbol{\mathsf{T}}^{v})$, and $\boldsymbol{\vartheta}_{0}$, $\boldsymbol{\vartheta}_{1}$, $\boldsymbol{\vartheta}_{2}$, $\boldsymbol{\vartheta}_{1}' \in V_{\varepsilon} \nrightarrow \boldsymbol{\mathsf{T}}^{v}$, if lub' $(\boldsymbol{\tau}_{1}, \boldsymbol{\tau}_{2}, T_{0}, \boldsymbol{\tau}', \boldsymbol{\vartheta}_{0})$ is (recursively) called from the main call lub' $(\boldsymbol{\tau}_{1}^{0}, \boldsymbol{\tau}_{2}^{0}, \varnothing, \boldsymbol{\tau}_{0}', \varepsilon)$ with hypothesis $\boldsymbol{\vartheta}_{1}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{1}^{0} \land \boldsymbol{\vartheta}_{2}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{2}^{0}$ and returns $\langle \boldsymbol{\tau}, T, \boldsymbol{\vartheta}' \rangle$, then

$$(\exists \beta \in \mathsf{dom}(T_0) \ . \ T_0(\beta) = \langle \boldsymbol{\tau}_1, \ \boldsymbol{\tau}_2 \rangle \wedge \boldsymbol{\tau}' = \gamma) \Rightarrow (\gamma \in \mathsf{dom}(\vartheta_0) \wedge \vartheta_0(\gamma) = \beta)$$

Proof of Lemma ?? We prove the stronger property that the following preinvariant and postinvariant do hold for any call $\langle \boldsymbol{\tau}, T, \vartheta' \rangle = \text{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \vartheta_0)$.

preinvariant
$$(\exists \beta \in \text{dom}(T_0) : T_0(\beta) = \langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle \wedge \boldsymbol{\tau}' = \gamma) \Rightarrow (\gamma \in \text{dom}(\theta_0) \wedge \theta_0(\gamma) = \beta)$$
 (25) postinvariant $(\exists \beta \in \text{dom}(T) : T(\beta) = \langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle \wedge \boldsymbol{\tau}' = \gamma) \Rightarrow (\gamma \in \text{dom}(\theta') \wedge \theta'(\gamma) = \beta)$

The proof is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??),..., (??.??), and by case analysis for the conditional.

- For the basis, the preinvariant of (??) holds vacuously at the first call (??.??) since $T_0 = \emptyset$;
- For the induction step, we proceed by case analysis.
 - In case (??.??), there is no recursive call to lub' and, by Lemma ??, the premiss of the postin-variant of (??) is ff so it does hold vacuously.
 - In case (??.??), the first recursive call at (??.??) satisfies the preinvariant because this preinvariant is assumed to hold for the intermediate call at (??).

In case n = 0, this is also the postinvariant.

Otherwise n > 0. Assume, by recurrence hypothesis, that the preinvariant holds before the call $\langle \boldsymbol{\tau}^i, T_i, \vartheta_i \rangle = \text{lub}'(\boldsymbol{\tau}_1^i, \boldsymbol{\tau}_2^n, T_{i-1}, \boldsymbol{\tau}_i', \vartheta_{i-1})$. Then, by induction hypothesis on the sequence of calls to lub', the postinvariant (??) holds for T_i and ϑ_i , which is the preinvariant of the next recursive call, if any.

It follows, by recurrence, that the postinvariant of (??) holds at (????) for T_n and ϑ_n .

- In case (??.??), we know by the test (??.??) and Lemma ?? that $\exists \beta \in \text{dom}(T_0)$. $T_0(\beta) = \langle \tau_1, \tau_2 \rangle \wedge \tau' = \gamma$ so by the preinvariant $\gamma \in \text{dom}(\vartheta_0)$ and $\vartheta_0(\gamma) = \beta$. Since $T = T_0$ and $\vartheta' = \vartheta_0$, we have $\gamma \in \text{dom}(\vartheta') \wedge \vartheta'(\gamma) = \beta$;
- In case (??.??), $\vartheta' = \beta[\gamma \leftarrow \vartheta_0]$, which implies the postinvariant (??).

Let us prove the converse of Lemma ??.

Lemma 26 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}', \boldsymbol{\tau} \in \boldsymbol{\mathsf{T}}^{\nu}, T_0, T \in \wp(V_{\bar{\varepsilon}} \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu})$, and $\boldsymbol{\vartheta}_0, \boldsymbol{\vartheta}_1, \boldsymbol{\vartheta}_2, \boldsymbol{\vartheta}' \in V_{\bar{\varepsilon}} \to \boldsymbol{\mathsf{T}}^{\nu}$, if lub' $(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \boldsymbol{\vartheta}_0)$ is (recursively) called from the main call lub' $(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \varepsilon)$ with hypothesis $\boldsymbol{\vartheta}_1(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \boldsymbol{\vartheta}_2(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ and returns $\langle \boldsymbol{\tau}, T, \boldsymbol{\vartheta}' \rangle$, then

$$\forall \beta, \gamma \in V_{\bar{t}} : (\gamma \in \mathsf{dom}(\vartheta_0) \land \vartheta_0(\gamma) = \beta) \Rightarrow (\beta \in \mathsf{dom}(T_0)).$$

П

Proof of Lemma ?? We prove the stronger property that the following preinvariant and postinvariant do hold for any call $\langle \boldsymbol{\tau}, T, \vartheta' \rangle = |\text{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \vartheta_0)$.

preinvariant
$$\forall \beta, \gamma \in V_{\hat{t}}$$
 . $(\gamma \in \text{dom}(\theta_0) \land \theta_0(\gamma) = \beta) \Rightarrow (\beta \in \text{dom}(T_0))$ postinvariant $\forall \beta, \gamma \in V_{\hat{t}}$. $(\gamma \in \text{dom}(\theta') \land \theta'(\gamma) = \beta) \Rightarrow (\beta \in \text{dom}(T))$ (27)

The proof is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??), and by case analysis for the conditional.

- For the basis, $\theta_0 = \varepsilon$ so dom $(\theta_0) = \emptyset$ so the preinvariant (??) holds vacuously;
- The induction step is by case analysis.
 - In case (??.??), there is no recursive call to lub' and $\vartheta' = f(\tau^1, ..., \tau^n)[\gamma \leftarrow \vartheta_0]$. So if $\alpha \in \text{dom}(\vartheta') \setminus \{\gamma\}$ then the postinvariant follows from the preinvariant. For $\gamma \in \text{dom}(\vartheta')$, we have $\vartheta'(\gamma) = f(\tau^1, ..., \tau^n) \notin V_{\pi}$ so that the postondition holds vacuously;
 - In case (??.??), the preinvariant of the first recursive call (??.??) holds by the preinvariant of (??) on the main call (??). Assuming the preinvariant holds for a following recursive call, the postinvariant holds by induction on the sequence of calls to lub', which is also the preinvariant of the next call. By recurrence the postinvariant of (??) holds for $\theta' = \theta_n$ and $T = T_n$ after the last call at (??.??);
 - In case (??.??), we have $\gamma \in \text{dom}(\vartheta') \wedge \vartheta'(\gamma) = \beta$ so the preinvariant (??) on the intermediate call trivially implies the postinvariant;
 - In case (??.??), $T = \langle \mathbf{\tau}_1, \mathbf{\tau}_2 \rangle [\beta \leftarrow T_0]$ and $\vartheta' = \beta [\gamma \leftarrow \vartheta_0]$. If $\alpha \in \text{dom}(\vartheta') \setminus \{\gamma\}$ and $\vartheta'(\alpha) = \beta'$ then $\alpha \in \text{dom}(\vartheta_0)$ and $\vartheta_0(\alpha) = \beta'$ then, by the preinvariant on the intermediate call, $\beta' \in \text{dom}(T_0) = \text{dom}(T)$. Otherwise, for $\gamma \in \text{dom}(\vartheta')$, we have $\vartheta'(\gamma) = \beta [\gamma \leftarrow \vartheta_0](\gamma) = \beta$ with $\beta \in \text{dom}(\langle \mathbf{\tau}_1, \mathbf{\tau}_2 \rangle [\beta \leftarrow T_0]) = \text{dom}(T)$.

The next Lemma ?? shows how the term variables are used.

```
Lemma 28 For all \boldsymbol{\tau}_{1}^{0}, \boldsymbol{\tau}_{2}^{0}, \boldsymbol{\tau}_{1}, \boldsymbol{\tau}_{2}, \boldsymbol{\tau}_{0}', \boldsymbol{\tau}', \boldsymbol{\tau} \in \boldsymbol{\mathsf{T}}^{\nu}, T_{0}, T \in \wp(V_{\ell} \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu}), and \boldsymbol{\vartheta}_{0}, \boldsymbol{\vartheta}_{1}^{0}, \boldsymbol{\vartheta}_{2}^{0}, \boldsymbol{\vartheta}' \in V_{\ell} \to \boldsymbol{\mathsf{T}}^{\nu}, if lub'(\boldsymbol{\tau}_{1}, \boldsymbol{\tau}_{2}, T_{0}, \boldsymbol{\tau}', \boldsymbol{\vartheta}_{0}) is (recursively) called from the main call lub'(\boldsymbol{\tau}_{1}^{0}, \boldsymbol{\tau}_{2}^{0}, \varnothing, \boldsymbol{\tau}_{0}', \varepsilon) with hypothesis \boldsymbol{\vartheta}_{1}^{0}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{1}^{0} \wedge \boldsymbol{\vartheta}_{2}^{0}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{2}^{0} and returns \langle \boldsymbol{\tau}, T, \boldsymbol{\vartheta}' \rangle, then

\text{preinvariant} \quad \text{wars} [[\boldsymbol{\vartheta}_{0}(V_{\ell})]] \subseteq \text{dom}(T_{0}) \tag{29}
```

(where
$$\theta_0(S) = \{\theta_0(\alpha) \mid \alpha \in S\}$$
 and $\text{vars}[S] = \bigcup \{\text{vars}[\tau] \mid \tau \in S\}$.)

postinvariant $vars[\theta'(V_{\pi})] \subseteq dom(T)$

Proof of Lemma ?? The proof is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??),..., (??.??), and by case analysis for the conditional.

- For the first call at (??.??), $\theta_0 = \varepsilon$ so $vars[\theta_0(V_t)] = vars[\varnothing] = \varnothing \subseteq dom(T_0)$;
- Otherwise the preinvariant of $(\ref{eq:thm.eq})$ holds for T_0 and ϑ_0 at the first recursive call $(\ref{eq:thm.eq})$. Assume, by induction hypothesis, that $\operatorname{vars}[\vartheta_{i-1}(V_t)] \subseteq \operatorname{dom}(T_{i-1})$ before the i^{th} call $(\ref{eq:thm.eq})$,..., $(\ref{eq:thm.eq})$, $i \in [1,n]$. By induction hypothesis on the sequence of calls to lub' , we have $\operatorname{vars}[\vartheta_i(V_t)] \subseteq \operatorname{dom}(T_i)$ after that call, which is also the preinvariant of the next call, if any. By recurrence, $\operatorname{vars}[\vartheta'(V_t)] = \operatorname{vars}[\vartheta_n(V_t)] \subseteq \operatorname{dom}(T_n) = \operatorname{dom}(T)$ in case the call $(\ref{eq:thm.eq})$ to lub' terminates at $(\ref{eq:thm.eq})$;
- If lub' terminates at (??.??), there are two cases.
 - $\operatorname{vars}[\theta'(\{\gamma\})] = \operatorname{vars}[f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)[\gamma \leftarrow \theta_0](\{\gamma\})] = \operatorname{vars}[f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)] = \bigcup_{i=1}^n \operatorname{vars}[\boldsymbol{\tau}^i].$ By Lemma $\ref{eq:substantial}$ and $\ref{eq:substantial}$, we have $\operatorname{vars}[\boldsymbol{\tau}^i] \subseteq \operatorname{dom}(T_i)$, $i=1,\dots,n$ and $\operatorname{dom}(T_i) \subseteq \operatorname{dom}(T_n)$ so that $\bigcup_{i=1}^n \operatorname{vars}[\boldsymbol{\tau}^i] \subseteq \bigcup_{i=1}^n \operatorname{dom}(T_i) \subseteq \operatorname{dom}(T_n) = \operatorname{dom}(T)$;
 - $\operatorname{vars}[\theta'(V_{\ell}\setminus\{\gamma\})] = \operatorname{vars}[f(\boldsymbol{\tau}^1,\ldots,\boldsymbol{\tau}^n)[\gamma\leftarrow\theta_0](V_{\ell}\setminus\{\gamma\})] = \operatorname{vars}[\theta_0(V_{\ell}\setminus\{\gamma\})] \subseteq \operatorname{vars}[\theta_0(V_{\ell})]$ which, by the preinvariant (??), is included in $\operatorname{dom}(T_0)$. By Lemma ?? and ??, $\operatorname{dom}(T_{i=1}) \subseteq \operatorname{dom}(T_i)$, $i=1,\ldots,n$ so that, by transitivity, $\operatorname{dom}(T_0) \subseteq \operatorname{dom}(T_n) = \operatorname{dom}(T)$. Therefore $\operatorname{vars}[\theta'(V_{\ell}\setminus\{\gamma\})] \subseteq \operatorname{dom}(T)$;
 - Since $\vartheta'(V_{\tilde{t}}) = \vartheta'(\{\gamma\}) \cup \vartheta'(V_{\tilde{t}} \setminus \{\gamma\})$, we conclude that $\operatorname{vars}[\![\vartheta'(V_{\tilde{t}})]\!] = \operatorname{vars}[\![\vartheta'(\{\gamma\})]\!] \cup \vartheta'(V_{\tilde{t}} \setminus \{\gamma\})]\!] = \operatorname{vars}[\![\vartheta'(\{\gamma\})]\!] \cup \operatorname{vars}[\![\vartheta'(V_{\tilde{t}} \setminus \{\gamma\})]\!] \subseteq \operatorname{dom}(\vartheta') \cup \operatorname{dom}(\vartheta') = \operatorname{dom}(\vartheta');$
- If lub' terminates at (??.??) then the postinvariant directly follows from the preinvariant of (??) since $T = T_0$ and $\theta' = \theta_0$;
- Finally, if lub' terminates at (??.??), there are two subcases.
 - We have $\operatorname{vars}[\theta'(\{\gamma\})] = \operatorname{vars}[\beta[\gamma \leftarrow \theta_0](\{\gamma\})] = \operatorname{vars}[\{\beta\}] = \{\beta\} \subseteq \operatorname{dom}(\langle \boldsymbol{\tau}_1, \ \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0]) = \operatorname{dom}(T);$

- Moreover $\operatorname{Vars} [\![\vartheta'(V_{\!\!\!t} \setminus \{\gamma\})]\!] = \operatorname{Vars} [\![\beta[\gamma \leftarrow \vartheta_0](V_{\!\!\!t} \setminus \{\gamma\})]\!] = \operatorname{Vars} [\![\vartheta_0(V_{\!\!\!t} \setminus \{\gamma\})]\!] \subseteq \operatorname{Vars} [\![\vartheta_0(V_{\!\!\!t} \setminus \{\gamma\}]\!] \subseteq \operatorname{Vars} [\![\vartheta_0(V_{\!\!\!t$
- We conclude since vars preserves joins.

The following series of lemmata aims at proving that the substitution built by lub' is the one allowing us to prove that lub returns the least common generalization.

Lemma 30 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}' \in \boldsymbol{\mathsf{T}}^{\vee}, T_0, T \in \wp(V_{\hat{\boldsymbol{\tau}}} \times \boldsymbol{\mathsf{T}}^{\vee} \times \boldsymbol{\mathsf{T}}^{\vee})$, and $\boldsymbol{\vartheta}_0, \boldsymbol{\vartheta}_1^0, \boldsymbol{\vartheta}_2^0, \boldsymbol{\vartheta}' \in V_{\hat{\boldsymbol{\tau}}} \to \boldsymbol{\mathsf{T}}^{\vee}$, if $\mathsf{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \boldsymbol{\vartheta}_0)$ is (recursively) called from the main call $\mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \varepsilon)$ with hypothesis $\boldsymbol{\vartheta}_1^0(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \boldsymbol{\vartheta}_2^0(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ and returns $\langle \boldsymbol{\tau}, T, \boldsymbol{\vartheta}' \rangle$, then

$$\vartheta_1^0(\boldsymbol{\tau}') = \boldsymbol{\tau}_1 \wedge \vartheta_2^0(\boldsymbol{\tau}') = \boldsymbol{\tau}_2. \tag{??}$$

Proof of Lemma ?? For the first call at (??.??), (??) holds by the hypothesis $\vartheta_1^0(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \vartheta_2^0(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ on the actual parameters. Assume that $\vartheta_j^0(\boldsymbol{\tau}') = \boldsymbol{\tau}_j$, j = 1, 2 before an intermediate call (??). Then (??) holds before the recursive calls (??.??), ..., (??.??) since the induction hypothesis $\vartheta_j^0(\boldsymbol{\tau}') = \boldsymbol{\tau}_j$, $\boldsymbol{\tau}' = f(\boldsymbol{\tau}_1', \dots, \boldsymbol{\tau}_n')$ by the test (??.??) which is false, $\boldsymbol{\tau}_j = f(\boldsymbol{\tau}_j^1, \dots, \boldsymbol{\tau}_j^n)$ by the test (??.??) which is true, and (48.30) imply that $\vartheta_j^0(\boldsymbol{\tau}') = \vartheta_j^0(f(\boldsymbol{\tau}_1', \dots, \boldsymbol{\tau}_n')) = f(\vartheta_j^0(\boldsymbol{\tau}_1'), \dots, \vartheta_j^0(\boldsymbol{\tau}_n')) = f(\boldsymbol{\tau}_j^1, \dots, \boldsymbol{\tau}_j^n) = \boldsymbol{\tau}_j$ and therefore $\vartheta_j^0(\boldsymbol{\tau}_i') = \boldsymbol{\tau}_j'$, $j = 1, \dots, n$. We conclude by induction on the sequence of calls to lub'.

Lemma 32 For all $\boldsymbol{\tau}_{1}^{0}$, $\boldsymbol{\tau}_{2}^{0}$, $\boldsymbol{\tau}_{1}$, $\boldsymbol{\tau}_{2}$, $\boldsymbol{\tau}_{0}'$, $\boldsymbol{\tau}'$, $\boldsymbol{\tau} \in \mathbf{T}^{\nu}$, T_{0} , $T \in \wp(V_{\bar{\epsilon}} \times \mathbf{T}^{\nu} \times \mathbf{T}^{\nu})$, and ϑ_{0} , ϑ_{1}^{0} , ϑ_{2}^{0} , $\vartheta' \in V_{\bar{\epsilon}} \to \mathbf{T}^{\nu}$, if $\mathsf{lub}'(\boldsymbol{\tau}_{1}, \boldsymbol{\tau}_{2}, T_{0}, \boldsymbol{\tau}', \vartheta_{0})$ is (recursively) called from the main call $\mathsf{lub}'(\boldsymbol{\tau}_{1}^{0}, \boldsymbol{\tau}_{2}^{0}, \varnothing, \boldsymbol{\tau}_{0}', \varepsilon)$ with hypothesis $\vartheta_{1}^{0}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{1}^{0} \wedge \vartheta_{2}^{0}(\boldsymbol{\tau}_{0}') = \boldsymbol{\tau}_{2}^{0}$ and returns $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$, then

preinvariant
$$\forall j = 1, 2 . \forall \alpha \in \text{dom}(\theta_0) . \theta_j^0(\alpha) = \overline{\varsigma}_j(T_0)(\theta_0(\alpha))$$
 (33)
postinvariant $\forall j = 1, 2 . \forall \alpha \in \text{dom}(\theta') . \theta_j^0(\alpha) = \overline{\varsigma}_j(T)(\theta'(\alpha)) \land \overline{\varsigma}_j(T)(\tau) = \tau_j$

Proof of Lemma ?? Notice again that Lemma **??**, **??**, and **??** are valid for lub' since they do not involve the extra parameters τ' , ϑ_0 , or result ϑ' . It follows, by Lemma **??**, that the postinvariant of (**??**) satisfies $\bar{\varsigma}_j(T)(\tau) = \tau_j$, j = 1, 2. The proof of (**??**) is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (**???**, **??**), (**??.**, **??**), and by case analysis for the conditional.

- For the basis, the preinvariant (??) holds vacuously for the main call (??.??) since $\theta_0 = \varepsilon$ so $dom(\theta_0) = \emptyset$;
- Assume that the preinvariant (??) holds before any intermediate call (??) of lub'. We must show that it holds before all recursive calls (??.??), ..., (??.??).

By hypothesis on the intermediate call, we have $\forall j = 1, 2 . \forall \alpha \in \text{dom}(\vartheta') . \vartheta_j^0(\alpha) = \overline{\varsigma}_j(T_0)(\vartheta'(\alpha))$ at the first recursive call (??.??).

Assume that $\forall j=1,2$. $\forall \alpha \in \text{dom}(\vartheta_{i-1})$. $\vartheta_j^0(\alpha)=\overline{\varsigma}_j(T_{i-1})(\vartheta_{i-1}(\alpha))$ before the i^{th} recursive call. By induction on the sequence of calls to lub', the postinvariant of (??) holds. Therefore we have $\forall j=1,2$. $\forall \alpha \in \text{dom}(\vartheta_i)$. $\vartheta_j^0(\alpha)=\overline{\varsigma}_j(T_i)(\vartheta_i(\alpha))$ before the $i+1^{\text{th}}$ call. By recurrence, all recursive calls do satisfy (??).

We must also show that the intermediate call satisfies the postinvariant of (??). We proceed by cases.

- In case (??.??), we have $T = T_n$ and θ_n which satisfy the postinvariant of (??), as shown above.
- In case (??.??), the postinvariant is $\forall j = 1, 2$. $\forall \alpha \in \text{dom}(f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)[\gamma \leftarrow \theta_0])$. $\theta_j^0(\alpha) = \bar{\zeta}_j(T_n)(f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)[\gamma \leftarrow \theta_0](\alpha))$.
 - $\begin{array}{l} \cdot \text{ If } \alpha \in \operatorname{dom}(\vartheta_0) \setminus \{\gamma\}, \text{ we must show that } \vartheta_j^0(\alpha) = \overline{\varsigma}_j(T_n)(\vartheta_0(\alpha)). \\ \text{ By Lemma } ??, \ \forall \alpha \in \operatorname{dom}(T_{i-1}) \ . \ T_{i-1}(\alpha) = T_i(\alpha), \ i = 1, \ldots, n \text{ so that, by transitivity,} \\ \forall \alpha \in \operatorname{dom}(T_0) \ . \ T_0(\alpha) = T_n(\alpha). \ \text{Therefore, by } (??), \text{ for all } \beta \in \operatorname{dom}(T_0), \ \overline{\varsigma}_j(T_0)\beta \triangleq \operatorname{let} \ \langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle = T_0(\beta) \text{ in } \boldsymbol{\tau}_j = \operatorname{let} \ \langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle = T_n(\beta) \text{ in } \boldsymbol{\tau}_j = \overline{\varsigma}_j(T_n)\beta. \text{ By Lemma } ??, \text{ vars}[\vartheta_0(V_{\boldsymbol{t}})] \subseteq \operatorname{dom}(T_0) \text{ so, in particular, } \forall \alpha \in \operatorname{dom}(\vartheta_0) \setminus \{\gamma\} \ . \ \text{ vars}[\vartheta_0(\alpha)] \subseteq \operatorname{dom}(T_0). \text{ This implies that } \forall \alpha \in \operatorname{dom}(\vartheta_0) \setminus \{\gamma\} \ . \ \forall \beta \in \text{ vars}[\vartheta_0(\alpha)] \ . \ . \ \overline{\varsigma}_j(T_0)\beta = \overline{\varsigma}_j(T_n)\beta. \text{ By } (48.30) \text{ and } (48.30), \text{ we infer that } \forall \alpha \in \operatorname{dom}(\vartheta_0) \setminus \{\gamma\} \ . \ . \ \overline{\varsigma}_j(T_0)\boxtimes_{\vartheta}(\Xi) = \overline{\varsigma}_j(T_n)\boxtimes_{\vartheta}(\Xi). \text{ By the preinvariant of } (??), \text{ we have } \forall \alpha \in \operatorname{dom}(\vartheta_0) \ . \ \vartheta_j^0(\alpha) = \overline{\varsigma}_j(T_0)(\vartheta_0(\alpha)). \text{ Therefore, by transitivity, } \vartheta_j^0(\alpha) = \overline{\varsigma}_j(T_n)(\vartheta_0(\alpha)). \end{array}$
 - · Otherwise $\alpha = \gamma$, in which case we must show that $\vartheta_j^0(\gamma) = \overline{\varsigma}_j(T_n)(f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n))$. By Lemma ??, (48.42) of Lemma 48.40, and (??.??), we have $\vartheta_j^0(\gamma) = \vartheta_j^0(\boldsymbol{\tau}') = \boldsymbol{\tau}_j = \overline{\varsigma}_j(T)(\boldsymbol{\tau}) = \overline{\varsigma}_j(T)(f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n))$.
- In case (??.??), the postinvariant of (??) immediately follows from the preinvariant since $T = T_0$ and $\vartheta' = \vartheta_0$;
- In case (??.??), we must show that $\forall j = 1, 2$. $\forall \alpha \in \text{dom}(\beta[\gamma \leftarrow \vartheta_0])$. $\vartheta_j^0(\alpha) = \overline{\varsigma}_j(\langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0])(\beta[\gamma \leftarrow \vartheta_0](\alpha))$. There are two cases.
 - · If $\alpha = \gamma$ then we must prove that $\vartheta_j^0(\gamma) = \overline{\varsigma}_j(\langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0])(\beta)$, that is, by (??), $\vartheta_j^0(\gamma) = \boldsymbol{\tau}_j$. It is not possible that $\gamma \in \text{dom}(\vartheta_0)$ since otherwise, we would have $\forall \beta \in \text{dom}(T_0)$. $T_0(\beta) \neq \langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle$ since the test (??.??) is if and $\boldsymbol{\tau}' = \gamma \in V_{\ell}$ by Lemma ??, which is in contradiction with (the contrapositive of) Lemma ??. Therefore $\vartheta_0(\gamma) = \gamma$ by (48.30). It follows that we have to prove that $\vartheta_j^0(\vartheta_0(\gamma)) = \boldsymbol{\tau}_j$, which directly follows from the preinvariant of (??):
 - · Otherwise, $\alpha \in \text{dom}(\vartheta_0) \setminus \{\gamma\}$ and we must show that $\vartheta_j^0(\alpha) = \overline{\varsigma}_j(\langle \pmb{\tau}_1, \pmb{\tau}_2 \rangle [\beta \leftarrow T_0])(\vartheta_0(\alpha))$. The test (??.??) implies $\beta \notin \text{dom}(T_0)$ and so $\beta \notin \text{vars}[\![\vartheta_0(\alpha)]\!]$ since $\text{vars}[\![\vartheta_0(V_{\!\!\!\ell})]\!] \subseteq \text{dom}(T_0)$ by (??) of Lemma ??. Therefore, by (??), $\forall \gamma \in \text{vars}[\![\vartheta_0(\alpha)]\!]$. $\overline{\varsigma}_j(T_0)(\gamma) = \overline{\varsigma}_j(\langle \pmb{\tau}_1, \pmb{\tau}_2 \rangle [\beta \leftarrow T_0])(\gamma)$. It follows, by (48.30) and (48.30), that $\overline{\varsigma}_i(T_0)(\vartheta_0(\alpha)) = \overline{\varsigma}_i(\langle \pmb{\tau}_1, \pmb{\tau}_2 \rangle [\beta \leftarrow T_0])(\gamma)$.

 $\boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0])(\vartheta_0(\alpha))$. We conclude, by the preinvariant (??) and transitivity that $\bar{\zeta}_j(\langle \boldsymbol{\tau}_1, \boldsymbol{\tau}_2 \rangle [\beta \leftarrow T_0])(\vartheta_0(\alpha)) = \vartheta_i^0(\alpha)$.

Lemma 34 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}', \boldsymbol{\tau} \in \boldsymbol{\mathsf{T}}^{\boldsymbol{\nu}}, T_0, T \in \wp(V_t \times \boldsymbol{\mathsf{T}}^{\boldsymbol{\nu}} \times \boldsymbol{\mathsf{T}}^{\boldsymbol{\nu}})$, and $\vartheta_0, \vartheta_1, \vartheta_2, \vartheta' \in V_t \to \boldsymbol{\mathsf{T}}^{\boldsymbol{\nu}}$, if $\mathsf{lub}'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \vartheta_0)$ is (recursively) called from the main call $\mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \varepsilon)$ with hypothesis $\vartheta_1(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \vartheta_2(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ and returns $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$, then the following postinvariant holds after the call.

$$dom(\theta') = dom(\theta_0) \cup vars[\tau']$$
 (??)

Proof of Lemma ?? The proof of (??) is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??),..., (??.??), and by case analysis for the conditional.

Consider any intermediate call $\langle \boldsymbol{\tau}, T, \vartheta' \rangle = \mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \boldsymbol{\varepsilon})$. We proceed by case analysis of the returned values $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$.

- In case (??.??), we have $\operatorname{dom}(\vartheta') = \operatorname{dom}(f(\boldsymbol{\tau}^1, \dots, \boldsymbol{\tau}^n)[\gamma \leftarrow \vartheta_0]) = \operatorname{dom}(\vartheta_0) \cup \{\gamma\} = \operatorname{do$
- In case (??.??), we have $\mathsf{dom}(\vartheta_i) = \mathsf{dom}(\vartheta_{i-1}) \cup \mathsf{vars}[\![\boldsymbol{\tau}^i]\!]$, $i = 1, \ldots, n$, by induction hypothesis on the sequence of calls to lub' . It follows that $\mathsf{dom}(\vartheta') = \mathsf{dom}(\vartheta_n) = \mathsf{dom}(\vartheta_0) \cup \bigcup_{i=1}^n \mathsf{vars}[\![\boldsymbol{\tau}^i]\!]$ = $\mathsf{dom}(\vartheta_0) \cup \mathsf{vars}[\![\boldsymbol{\tau}^i]\!]$;
- In case (??.??), we have $\theta' = \beta[\gamma \leftarrow \theta_0]$ so $dom(\theta') = dom(\theta_0) \cup \{\gamma\} = dom(\theta_0) \cup vars[\tau']$ since $\tau' = \gamma$ by Lemma ??;
- Finally, in case (??.??), $dom(\theta') = dom(\beta[\gamma \leftarrow \theta_0]) = dom(\theta_0) \cup \{\gamma\} = dom(\theta_0) \cup vars[\tau']$ since $\tau' = \gamma$ by Lemma ??.

Lemma 36 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}'^0, \boldsymbol{\tau}^{n-1}, \boldsymbol{\tau}^n, \boldsymbol{\tau}^{m-1}.\boldsymbol{\tau}^m \in \mathbf{T}^v, T_n, T_m \in \wp(V_{\hat{t}} \times \mathbf{T}^v \times \mathbf{T}^v),$ consider any computation trace for the main call $\mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}'^0, \varepsilon, \varnothing)$ at (??.??) with hypothesis $\vartheta_1(\boldsymbol{\tau}'^0) = \boldsymbol{\tau}_1^0 \wedge \vartheta_2(\boldsymbol{\tau}'^0) = \boldsymbol{\tau}_2^0$. Assume that in this computation trace, a call $\langle \boldsymbol{\tau}^k, T_k \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{k-1})$ is followed by a later call $\langle \boldsymbol{\tau}^m, T_m \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{m-1})$ with the same parameters $\boldsymbol{\tau}_1$ and $\boldsymbol{\tau}_2$. Then $\boldsymbol{\tau}^k = \boldsymbol{\tau}^m$.

By Lemma ??, this also holds for calls to lub' independently of the other two parameters.

Proof of Lemma ?? By (??) in Lemma ??, Lemma ??, (??.??), ..., (??.??), and (??.??), ..., (??.??) and recurrence, the successive calls of lub and lub' in the trace have parameters T_i and result T_{i+1} with increasing domains and preservation of the previous values so that $\forall \alpha \in \text{dom}(T_k)$. $T_k(\alpha) = T_m(\alpha)$.

L o

To prove that $\boldsymbol{\tau}^k = \boldsymbol{\tau}^m$, we consider the calls $\langle \boldsymbol{\tau}^k, T_k \rangle = \text{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{k-1})$ and the later $\langle \boldsymbol{\tau}^m, T_m \rangle = \text{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{m-1})$ to lub (by Lemma ??, the reasoning is the same for lub'). The only possible executions are the following.

- If one execution follows the true branch of (48.68.1), so does the other since they have the same parameters. By recurrence and induction on the sequence of calls for (48.68.2), ..., (48.68.4) with $\forall \alpha \in \text{dom}(T_{i-1})$. $T_{i-1}(\alpha) = T_i(\alpha)$, i = 1, ..., n, we have $\boldsymbol{\tau}^k = f(\boldsymbol{\tau}^{1^k}, ..., \boldsymbol{\tau}^{n^k}) = f(\boldsymbol{\tau}^{1^m}, ..., \boldsymbol{\tau}^{n^m}) = \boldsymbol{\tau}^m$;
- If both calls go through (48.68.7) then obviously $\tau^k = \tau^m = \beta$;
- Both calls cannot go through (48.68.9) since the first ones (which is $\langle \boldsymbol{\tau}^k, T_k \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{k-1})$) that goes through (48.68.9) will add β to the dom $(T_k) \subseteq \mathsf{dom}(T_{m-1})$;
- If $\langle \boldsymbol{\tau}^k, T_k \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{k-1})$ goes through (48.68.9) then the call $\langle \boldsymbol{\tau}^m, T_m \rangle = \mathsf{lub}(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_{m-1})$ must go through (48.68.7) since $\mathsf{dom}(T_k) \subseteq \mathsf{dom}(T_{m-1})$ with $\beta \in \mathsf{dom}(T_{m-1})$ so that $\boldsymbol{\tau}^k = \boldsymbol{\tau}^m = \beta$.

Lemma 37 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}', \boldsymbol{\tau} \in \boldsymbol{\mathsf{T}}^{\nu}, T_0, T \in \wp(V_{\hat{\boldsymbol{x}}} \times \boldsymbol{\mathsf{T}}^{\nu} \times \boldsymbol{\mathsf{T}}^{\nu})$, and $\boldsymbol{\vartheta}_0, \boldsymbol{\vartheta}_1, \boldsymbol{\vartheta}_2, \boldsymbol{\vartheta}' \in V_{\hat{\boldsymbol{x}}} \to \boldsymbol{\mathsf{T}}^{\nu}$, if lub' $(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \boldsymbol{\vartheta}_0)$ is (recursively) called from the main call lub' $(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\varnothing}, \boldsymbol{\tau}_0', \boldsymbol{\varepsilon})$ with hypothesis $\boldsymbol{\vartheta}_1(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \boldsymbol{\vartheta}_2(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ and returns $\langle \boldsymbol{\tau}, T, \boldsymbol{\vartheta}' \rangle$, then the following postinvariant holds after the call.

$$\forall \alpha \in \mathsf{dom}(\vartheta_0) \ . \ \vartheta_0(\alpha) = \vartheta'(\alpha) \tag{??} \quad \Box$$

Proof of Lemma ?? The proof of (??) is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??),..., (??.??), and by case analysis for the conditional.

Consider any intermediate call $\langle \boldsymbol{\tau}, T, \vartheta' \rangle = \mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \boldsymbol{\varepsilon})$. We proceed by case analysis of the returned values $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$.

• In case (??.??), we have $\forall \alpha \in \text{dom}(\theta_0) \setminus \{\gamma\}$. $\theta_0(\alpha) = f(\tau^1, \dots, \tau^n)[\gamma \leftarrow \theta_0](\alpha) = \theta'(\alpha)$.

It may also be that $\gamma \in \text{dom}(\vartheta_0)$. Since the main call starts with ε and by (??) the domain of ϑ_0 grows along the calls, there must be a previous call that added γ to $\text{dom}(\vartheta_0)$. At that previous call, say $\text{lub}'(\tau_1^k, \tau_2^k, T_0^k, \tau'^k, \vartheta_0^k)$, we had $\tau'^k = \gamma$ since (??.??) and (??.??) are the two only cases where the domain of ϑ_0^k is extending with γ . By the initial hypothesis and (??) of Lemma ??, $\vartheta_j^0(\tau'^k) = \vartheta_j^0(\gamma) = \tau_j^k$. At the current call $\text{lub}'(\tau_1, \tau_2, T_0, \tau', \vartheta_0)$ where $\tau'_0 = \gamma$, we also have, by the initial hypothesis and (??) of Lemma ??, that $\vartheta_j^0(\tau') = \vartheta_j^0(\gamma) = \tau_j$. By transitivity $\tau_j^k = \tau_j$. So the current and previous calls had the same first two parameters. It follows, by Lemma ??, that they have the same results. This implies that necessarily, $\vartheta_0(\gamma) = f(\tau^1, \dots, \tau^n)$.

- In case (??.??), we have $\forall \alpha \in \text{dom}(\theta_{i-1})$. $\theta_{i=1}(\alpha) = \theta_i(\alpha)$, i = 1, ..., n, by induction hypothesis on the sequence of calls to lub'. It follows, by transitivity, that $\forall \alpha \in \text{dom}(\theta_0)$. $\theta_0(\alpha) = \theta_n(\alpha) = \theta'(\alpha)$;
- In case (??.??), for all $\alpha \in \text{dom}(\vartheta_0) \setminus \{\gamma\}$, we have $\vartheta_0(\alpha) = \beta[\gamma \leftarrow \vartheta_0](\alpha) = \vartheta'(\alpha)$. We may also have $\gamma \in \text{dom}(\vartheta_0)$, in which case the test (??.??), Lemma ??, and Lemma ?? imply that $\vartheta_0(\gamma) = \beta$ so $\vartheta_0(\gamma) = \beta = \beta[\gamma \leftarrow \vartheta_0](\gamma) = \vartheta'(\gamma)$;
- Finally, in case (??.??), it is not possible that $\gamma \in \text{dom}(\theta_0)$ since otherwise, we would have $\forall \beta \in \text{dom}(T_0)$. $T_0(\beta) \neq \langle \tau_1, \tau_2 \rangle$ since the test (??.??) is ff and $\tau' = \gamma \in V_{\bar{x}}$ by Lemma ??, which is in contradiction with (the contrapositive of) Lemma ??. It follows that $\forall \alpha \in \text{dom}(\theta_0)$. $\theta_0(\alpha) = \beta[\gamma \leftarrow \theta_0](\alpha) = \theta'(\alpha)$ since $\alpha \neq \gamma$.

Lemma 39 For all $\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \boldsymbol{\tau}_0', \boldsymbol{\tau}', \boldsymbol{\tau} \in \boldsymbol{\mathsf{T}}^{\vee}, T_0, T \in \wp(V_{\bar{t}} \times \boldsymbol{\mathsf{T}}^{\vee} \times \boldsymbol{\mathsf{T}}^{\vee})$, and $\vartheta_0, \vartheta_1, \vartheta_2, \vartheta' \in V_{\bar{t}} \to \boldsymbol{\mathsf{T}}^{\vee}$, if lub' $(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, T_0, \boldsymbol{\tau}', \vartheta_0)$ is (recursively) called from the main call lub' $(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \varepsilon)$ with hypothesis $\vartheta_1(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_1^0 \wedge \vartheta_2(\boldsymbol{\tau}_0') = \boldsymbol{\tau}_2^0$ and returns $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$, then the following postinvariant holds after the call.

$$\vartheta'(\tau') = \tau$$
 (??)

Proof of Lemma ?? The proof of (??) is by induction on the sequence of calls to lub' and, for any given call, by recurrence to handle the recursive calls at (??.??), (??.??),..., (??.??), and by case analysis for the conditional.

Consider any intermediate call $\langle \boldsymbol{\tau}, T, \vartheta' \rangle = \mathsf{lub}'(\boldsymbol{\tau}_1^0, \boldsymbol{\tau}_2^0, \varnothing, \boldsymbol{\tau}_0', \boldsymbol{\varepsilon})$. We proceed by case analysis of the returned values $\langle \boldsymbol{\tau}, T, \vartheta' \rangle$.

- In case (??.??), we have $\vartheta'(\tau') = f(\tau^1, \dots, \tau^n)[\gamma \leftarrow \vartheta_0](\gamma) = f(\tau^1, \dots, \tau^n) = \tau$;
- In case (??.??), we handle (??.??), ..., (??.??) by recurrence.
 - For the basis at (??.??), we have $dom(\theta_1) = dom(\theta_0) \cup vars[\tau'_1]$ by (??) of Lemma ??, and $\theta_1(\tau'_1) = \tau^1$, by induction on the sequence of calls to lub';
 - Assume, by recurrence hypothesis, that for the i^{th} call (??.??), ..., (??.??), $i \in [1, n[$, we have

$$\begin{aligned} \operatorname{dom}(\vartheta_i) &= \operatorname{dom}(\vartheta_0) \cup \bigcup_{j=1}^i \operatorname{vars}[\![\boldsymbol{\tau}_j']\!] \land \\ \forall j \in [1, i] \ . \ \forall \alpha \in \operatorname{dom}(\vartheta_j) \ . \ \vartheta_i(\alpha) = \vartheta_j(\alpha) \land \\ \forall j \in [1, i] \ . \ \vartheta_i(\boldsymbol{\tau}_j') = \vartheta_i(\boldsymbol{\tau}_j') = \boldsymbol{\tau}^j \end{aligned} \tag{41}$$

- At the next $i + 1^{th}$ call, we have
 - 1. By (??) of Lemma ?? and recurrence hyp. (??), $\operatorname{dom}(\vartheta_{i+1}) = \operatorname{dom}(\vartheta_i) \cup \operatorname{vars}[\![\boldsymbol{\tau}'_{i+1}]\!] = \operatorname{dom}(\vartheta_0) \cup \bigcup_{j=1}^{i+1} \operatorname{vars}[\![\boldsymbol{\tau}'_j]\!];$

- 2. By (??) of Lemma ??, we have $\forall \alpha \in \mathsf{dom}(\vartheta_i)$. $\vartheta_i(\alpha) = \vartheta_{i+1}(\alpha)$ so that by recurrence hyp. (??), $\forall j \in [1, i+1]$. $\forall \alpha \in \mathsf{dom}(\vartheta_j)$. $\vartheta_{i+1}(\alpha) = \vartheta_i(\alpha) = \vartheta_i(\alpha)$
- 3. By $(\ref{eq:total_sign})$, $\forall j \in [1,i+1]$. extstyle extsty

By recurrence, (??) holds for i = n. Therefore $\vartheta'(\tau') = \vartheta_n(f(\tau'_1, \dots, \tau'_n)) = f(\vartheta_n(\tau'_1), \dots, \vartheta_n(\tau'_n)) = f(\tau^1, \dots, \tau^n) = \tau$.

- In case (??.??), we have $\exists \beta \in \text{dom}(T_0)$. $T_0(\beta) = \langle \tau_1, \tau_2 \rangle \wedge \tau' = \gamma$ so that by Lemma ??, we have $\gamma \in \text{dom}(\theta_0) \wedge \theta_0(\gamma) = \beta$. It follows that $\theta'(\tau') = \theta_0(\gamma) = \beta = \tau$.
- Finally, in case (??.??), by (??.??) and Lemma ??, we have $\vartheta'(\tau') = \beta[\gamma \leftarrow \vartheta_0](\gamma) = \beta = \tau$.

Proof of Theorem 48.72 By Lemma **??**, $[\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}}$ is a $\leq_{=^{\nu}}$ -upper-bound of $[\boldsymbol{\tau}_1]_{=^{\nu}}$ and $[\boldsymbol{\tau}_2]_{=^{\nu}}$. By Lemma **??**, so is $[\lg c'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)]_{=^{\nu}}$.

Now if $[\boldsymbol{\tau}']_{=^{\nu}}$ is any $\leq_{=^{\nu}}$ -upper-bound of $[\boldsymbol{\tau}_1]_{=^{\nu}}$ and $[\boldsymbol{\tau}_2]_{=^{\nu}}$ then by Exercise 48.16, $\exists \theta_1, \theta_2$. $\theta_1(\boldsymbol{\tau}') = \boldsymbol{\tau}_1 \land \theta_2(\boldsymbol{\tau}') = \boldsymbol{\tau}_2$, which is the precondition (??.??). It follows that the call to lub' $(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2, \varnothing, \boldsymbol{\tau}', \varepsilon, \varnothing)$ terminates (by Lemma ?? and ??) and returns $\langle \lg c'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2), T, \theta' \rangle$ such that $\theta'(\boldsymbol{\tau}') = \lg c'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)$ (by (??) of Lemma ??). By Exercise 48.16, this means that $\lg c'(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2) \leq_{=^{\nu}} [\boldsymbol{\tau}']_{=^{\nu}}$. This proves by Lemma ?? that $\lg c(\boldsymbol{\tau}_1, \boldsymbol{\tau}_2)$ is the $\leq_{=^{\nu}}$ -least upper-bound of $[\boldsymbol{\tau}_1]_{=^{\nu}}$ and $[\boldsymbol{\tau}_2]_{=^{\nu}}$.
